World Cup 2026
Results and regional analysis

Ten published report pages, collected in one searchable edition.

This edition preserves the published findings, figures, tables, sources and counting rules. Broadcast audience estimates and torrent memberships remain separate measures; memberships do not count viewers.

The main sample/cache audit covers June 29–November 3, 2026. Individual comparisons retain their stated windows, limitations and evidence cutoffs.

Expanded disclosure sections and all eight authored China explorer views are included. Stacked chart panels appear on separate plates. Links to underlying data and the live maps remain available online.

Compiled from the published Alpha60 reports on November 11, 2026. This is an export of the existing analysis, with a final Devastation Pacific Coda / Share appendix.

Contents

Use the linked contents or PDF bookmarks to navigate. Wide graphics and dense tables use larger pages; choose “Fit” when printing on smaller paper.

World Cup 2026: distribution, languages, and sources

Read the published page online

> **Sampling began June 29, 2026 — Round of 32.** This snapshot runs through November 3. It describes observed peer-to-peer distribution during that window, including later circulation of older matches. It does not measure the full tournament's live audience.
>
> Eight reports share one canonical torrent inventory, IPinfo geography at H3 resolution 8, and inspectable evidence for every comparison.

Results

World Cup 2026 sample and cache audit

Explore the eight reports

Formats and resolution

Video dimensions, codecs, encoder coverage and regional resolution mix.

Audio and subtitles

English, Spanish and French counts; all 493 hashes; language combinations and packaging.

Language and geography

North American language distribution, census comparisons and their limits.

North America and matches

Host-country totals, top upload/download locations, and equal-age match windows.

Broadcasters and services

Evidence-based branding candidates and 22 native Cahill–Keyes maps.

Asia-28 and China

Asia-28 rankings, temporal coverage, matched-age media comparisons and China hypotheses.

Latin America and South America

Latin America and the Caribbean, with South America shown separately: places, networks, files and observation age.

Preparing for 2027

What changes in Brazil, and a concrete sampling and analysis backlog.

What the snapshot establishes

Measure	Result
Canonical torrents	493 unique BTIHA; all 574 media observations joined
Video dimensions	430 identified; 63 unknown
Audio-language coverage	335 identified; 158 unknown
English / Spanish / French audio	188 / 7 / 2 torrents; categories can overlap
Branding attribution	360 assigned candidates in 21 families; 130 unknown and 3 conflicts
Geographic products	149 H3r8 files and 149 matched H3r5 comparison files validated
Observation window	June 29–November 3, 2026; 128 dates

The largest identified format is 1080-height AVC video. Language evidence is substantially stronger for English than Spanish or French. South Korea and China lead the observed Asia-28 distribution. The data do not establish individual listening choices, ethnic identity, national fandom, or a FOX–Telemundo audience crossover.

Methods and coverage

The shared inventory builder preserves original `.torrent` info-byte hashes, full v2 hashes and verified hybrid aliases. Filenames are content evidence and source references, not identity keys. The six initially unmatched media hashes are verified v1/v2 aliases; no unmatched media records remain. The one metadata variation is a zero versus nonzero cached-file-size reading, not conflicting language or codec values.

The geographic denominator begins with **56,594,924 downloader and 539,766 uploader IP–canonical-torrent memberships**. An IP is unique within each torrent, role and interval; it may recur across torrents, roles and dates. Native “downloader” and “uploader” labels do not measure viewing or transferred traffic.

The native producer excludes unusable coordinates before H3 aggregation. Minimum-cell filtering then depends on whether counts are grouped per torrent or across the collection. Both representations are retained and labeled:

Representation	Downloader memberships	Uploader memberships
Unfiltered source memberships	56,594,924	539,766
Excluded: missing usable coordinates	171,965	77
Mapped before cell threshold	56,422,959	539,689
H3r5, collection aggregate, retained	56,416,490	539,660
H3r5, per torrent, retained	53,602,334	525,502
H3r8, collection aggregate, retained	56,407,686	539,629
H3r8, per torrent, retained	52,333,440	519,041

For H3r8, the per-torrent threshold removes 4,089,519 mapped downloader memberships and 20,648 uploader memberships. The aggregate threshold removes 15,273 and 60 respectively. Content tables and vendor maps use the per-torrent representation; overall country/city rankings use the aggregate. Their totals should not be added or substituted for each other. Complete loss accounting

IPinfo’s location database build epoch is `1777968300` (May 5, 2026). Its version and the companion database checksums are pinned in the source manifest. This is a retrospective, fixed-snapshot lookup, not proof that every address had the same location throughout collection. The generator reports zero lookup exceptions, but that metric is not equivalent to complete geolocation coverage.

An H3r8 cell averages about 0.74 square kilometers, which can be much smaller than IP geolocation uncertainty. The standard location source used here does not provide an accuracy-radius field for this analysis. Native cells retain one representative country’s/city’s label from the first constituent location; H3r5 and H3r8 can therefore differ in country/city assignment as well as filtering. This is why the resolution comparison remains part of the evidence. H3 statistics, IPinfo extended-geolocation fields

The catalog expands from **two torrents with a daily cache on June 29 to 416 on July 19**, and 491 on November 3. Fixed-cohort and first-observation windows are therefore preferable to interpreting a growing total as changing interest. The two focus-match comparisons include seven observed dates for every selected

canonical torrent, with alias coverage retained separately.

The public files contain aggregated geography and content metadata. Unfiltered small-cell products and cached video fragments remain local; their checksums and review evidence support the analysis.

H3r8 products

Resolution 8 is the highest resolution used in this analysis. The full native products are saved in the top-level `H3r8` directory and available below as compressed GeoJSON: 128 daily files, 19 weekly files, and two cumulative representations. All serialized cell indices and recorded resolution fields passed validation. The H3r5 baseline uses exactly the same frozen IPinfo databases.

Sources, downloads, and counting rules

Source manifest · Validation summary

All content joins use the shared inventory: **493 canonical BTIHA**, with verified hybrid-hash aliases. Alpha60 sampling began **June 29, 2026 — Round of 32**, and ends November 3 in this snapshot. Earlier-event media found later does not establish earlier sampling.

Geographic counts are **IP–torrent memberships**, with an IP counted once per canonical torrent and role within the stated interval. They are not unique people, viewing choices, completed downloads, transferred bytes, or ratings. An address can occur in both roles. Daily sums count the same membership again on another day.

Main geography uses **IPinfo and H3 resolution 8**, the highest resolution used here. The native minimum is **three downloaders per cell**; uploaders are retained only where that downloader threshold passes. Content comparisons filter each torrent separately. Overall country and city comparisons filter after aggregating torrents, so their totals differ. Country and city labels are representative locations within cells, and the finer grid does not improve IPinfo accuracy. Hosting, VPN, proxy and mobile flags overlap; each sensitivity exclusion is applied separately.

See the H3r8 manifest, generation and validation evidence, complete analytical reductions, and methods and coverage. Source hashes make the published snapshot inspectable.

Formats and resolution

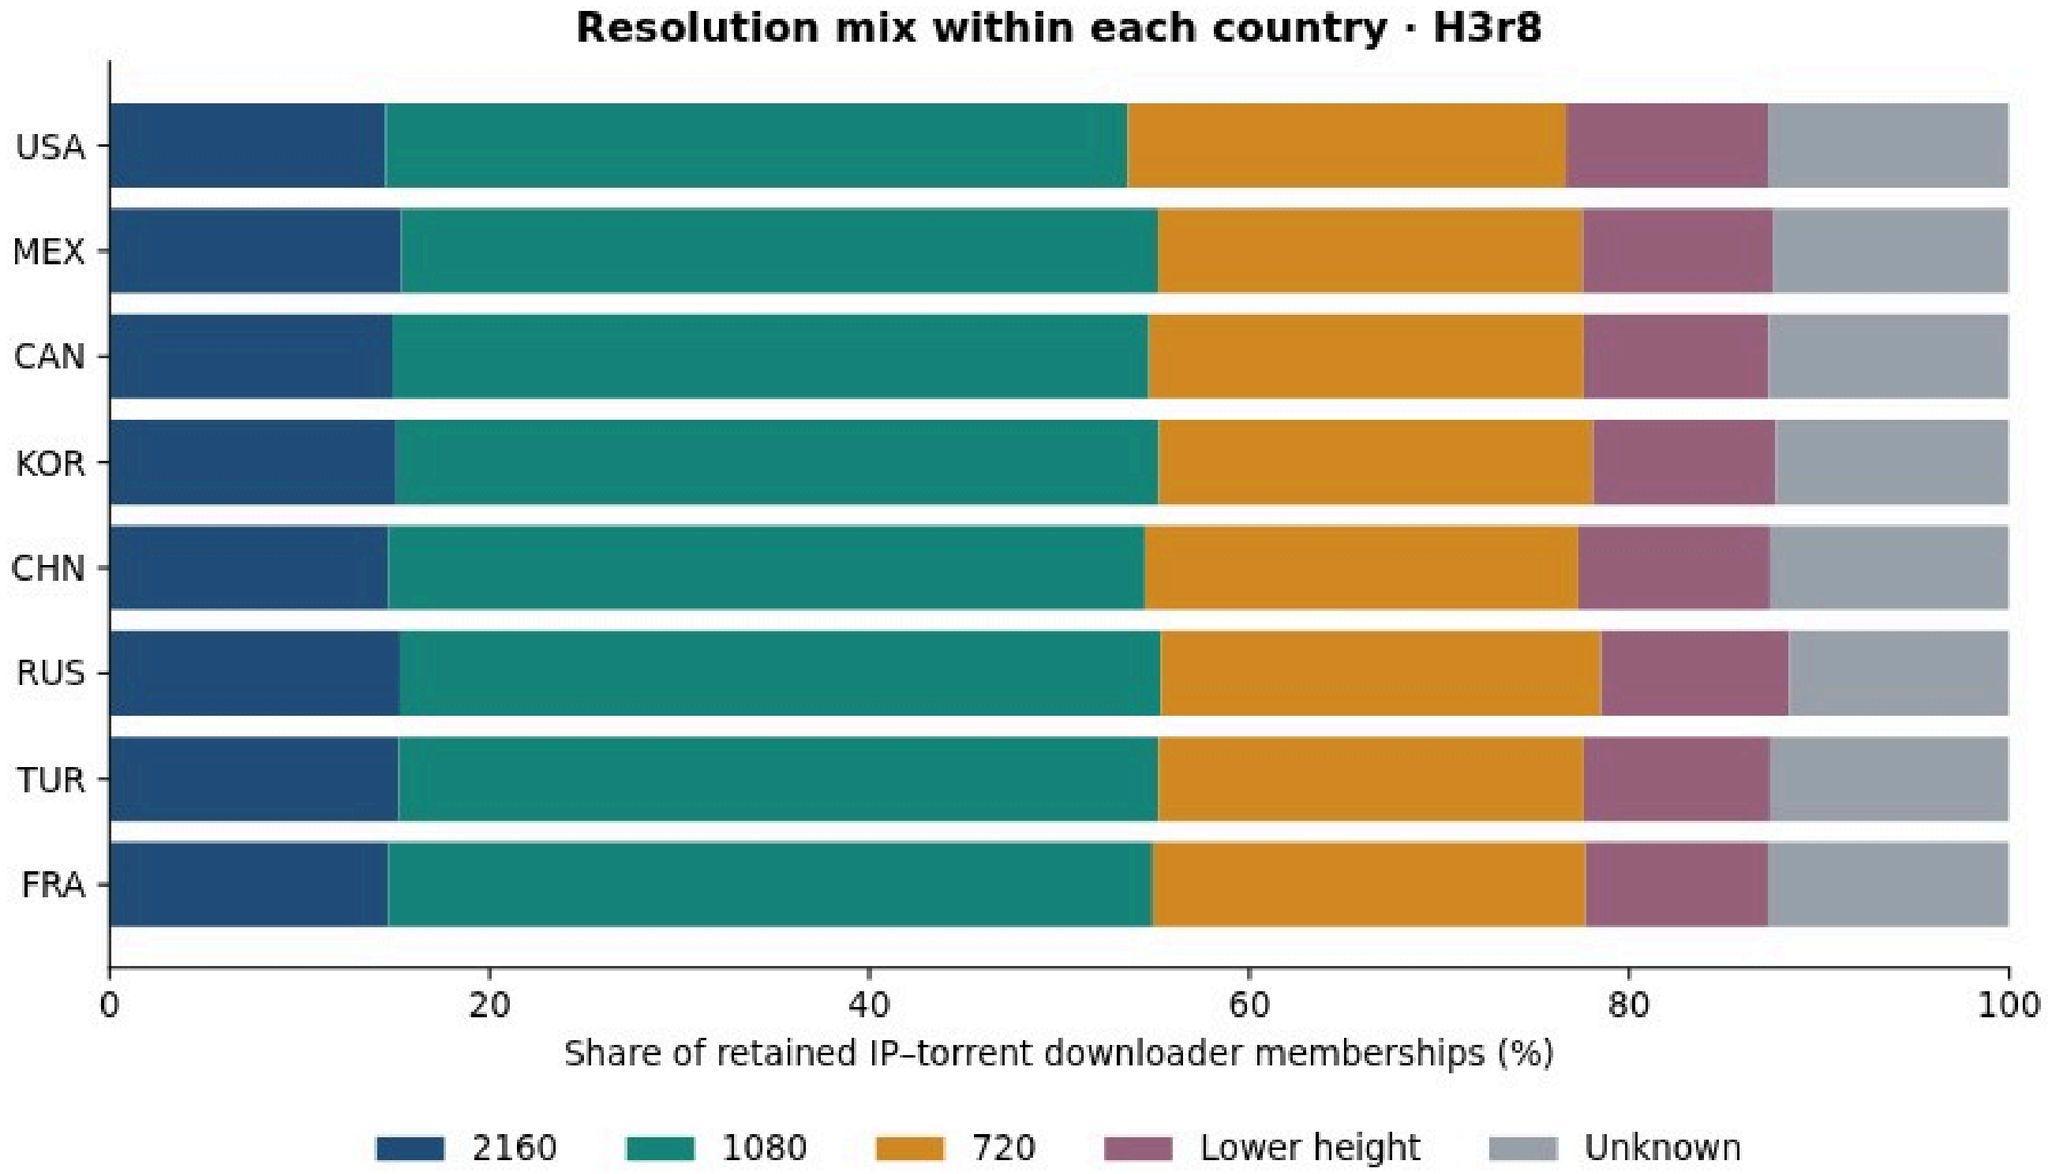

Read the published page online

1080-height video and AVC dominate the identified torrent inventory. Encoder coverage is too sparse to rank implementations across the whole swarm.

What is distributed

Dimensions are available for **430 of 493 torrents (87.2%)**. The largest identified class is 1080 pixels high: 203 torrents. These are dimensions in the cached media probe, not a guarantee that every file in a multi-file torrent has that format. A 1080-height field also does not reliably distinguish progressive from interlaced material.

Video height	Torrents	Share of all 493	Downloader memberships	Share of retained memberships
2160 px high	59	12.0%	7,846,203	15.0%
1080 px high	203	41.2%	20,888,395	39.9%
720 px high	128	26.0%	11,915,133	22.8%
540 px high	8	1.6%	797,782	1.5%
480 px high	23	4.7%	3,221,222	6.2%
400 px high	9	1.8%	1,199,993	2.3%
unknown	63	12.8%	6,464,712	12.4%

Country shares use the same per-torrent H3r8 threshold as the content analysis. Unknown metadata remains in the denominator; colors do not represent viewing quality or consumption. Open full-size chart (SVG).

Country	Largest height group	Group share	2160-height share
United States	1080	39.1%	14.5%
Mexico	1080	39.8%	15.4%
Canada	1080	39.9%	14.9%
South Korea	1080	40.1%	15.1%
China	1080	39.8%	14.6%
Russia	1080	40.1%	15.3%
Türkiye	1080	40.0%	15.2%
France	1080	40.2%	14.7%

Codecs, containers, and encoders

H.264 / AVC is the most common identified video codec, with **355 torrents (72.0% of all 493)**. Codec IDs from Matroska, MP4 and MPEG-TS are normalized into the same codec families. The independent fragment probe recognizes 348 Matroska-family containers, 36 MP4-family containers and 44 MPEG-TS containers; 65 torrents lack a usable container result. Those are probe container families, not filename extension counts.

Video codec family	Torrents	Share of all 493
H.264 / AVC	355	72.0%
H.265 / HEVC	60	12.2%
MPEG-2 video	11	2.2%
AV1	4	0.8%
Unknown	63	12.8%

Only **16 torrents (3.2%)** expose a video encoder tag: eight `obs_x264`, six `Lavc56.60.100 libx264`, and two `Lavc57.89.100 libx264`. All identified encoder tags point to x264, but **477 unknown encoder records prevent a claim about the most popular encoder across the whole inventory**. A codec is not an encoder implementation.

Audio and metadata quality

Audio property	Torrents	Share of all 493
2 channels	339	68.8%
6 channels	91	18.5%
48,000 Hz sampling	359	72.8%

Audio property	Torrents	Share of all 493
44,100 Hz sampling	71	14.4%
Unknown channels or sampling rate	63	12.8%

AAC is the dominant named audio family. Raw audio codec IDs, sampling rates and channels remain in the downloadable analysis. The reported 32-bit field on 98 records is not treated as proof of lossless audio or effective source precision.

Eight source frame-rate fields contain implausible readings above 6,000 frames per second. They are excluded from frame-rate conclusions. Independent `ffprobe` readings fall between 25.0 and 60.0 frames per second for those fragments; both readings are retained in the metadata anomalies. Rates and durations derived from partial fragments should not be projected to a whole match.

Findings to carry forward

1. **HD dominates the identified inventory.** The 203 1080-height and 128 720-height torrents together account for 67.1% of all hashes; availability and observed membership weight are separate measures.
2. **Codec compatibility appears important in this observed distribution.** AVC greatly exceeds HEVC and AV1 in identified torrent counts. This is a packaging observation, not evidence of which devices viewers own.
3. **Missing metadata is a material selection issue.** The 63 torrents without dimensions and the much larger encoder gap should remain visible in every regional comparison. Improve fragment decoding and file-level probing before interpreting finer quality preferences.

Sources, downloads, and counting rules

Torrent inventory CSV · Media anomaly checks · Packaging and probe evidence

All content joins use the shared inventory: **493 canonical BTIHA**, with verified hybrid-hash aliases. Alpha60 sampling began **June 29, 2026 — Round of 32**, and ends November 3 in this snapshot. Earlier-event media found later does not establish earlier sampling.

Geographic counts are **IP–torrent memberships**, with an IP counted once per canonical torrent and role within the stated interval. They are not unique people, viewing choices, completed downloads, transferred bytes, or ratings. An address can occur in both roles. Daily sums count the same membership again on another day.

Main geography uses **IPinfo and H3 resolution 8**, the highest resolution used here. The native minimum is **three downloaders per cell**; uploaders are retained only where that downloader threshold passes. Content comparisons filter each torrent separately. Overall country and city comparisons filter after aggregating torrents, so their totals differ. Country and city labels are representative locations within cells, and the finer grid does not improve IPinfo accuracy. Hosting, VPN, proxy and mobile flags overlap; each sensitivity exclusion is applied separately.

See the H3r8 manifest, generation and validation evidence, complete analytical reductions, and methods and coverage. Source hashes make the published snapshot inspectable.

Audio languages and subtitles

Read the published page online

The 493 canonical torrents include 188 with identified English audio, seven with Spanish audio, and two with French audio. Missing track metadata remains part of the denominator.

English, Spanish, and French

Audio language is identified for **335 torrents (68.0%)**; 158 are unclassified. At least one subtitle language is identified for **50 torrents (10.1%)**; the other 443 do not have a classified subtitle language. An empty or failed probe is not evidence that subtitles are absent.

Language	Track type	Unique BTIHA	Share of all 493	Share with classified track language
English	Audio	188	38.1%	56.1%
English	Subtitles	47	9.5%	94.0%
Spanish	Audio	7	1.4%	2.1%
Spanish	Subtitles	1	0.2%	2.0%
French	Audio	2	0.4%	0.6%
French	Subtitles	0	0.0%	0.0%

The audio denominator in the last column is 335; the subtitle denominator is 50. A multilingual torrent contributes once to every language it contains, so language shares can overlap. `fre` and `fra` are normalized to French; placeholder tokens remain unknown.

Languages and combinations

There are **11 identified audio languages**, **eight identified subtitle languages**, and **14 distinct languages across either track type**. A torrent's languages are the union of its probe observations; this does not certify exhaustive track coverage across a multi-file package.

Language	Audio torrents	Subtitle torrents
English	188	47
Spanish	7	1
French	2	0
Russian	110	2

Language	Audio torrents	Subtitle torrents
Bulgarian	22	0
Ukrainian	9	0

Packaging and size

Identified audio languages	Torrents	Median payload GB	Payload range GB	Median media files
Unknown	158	5.78	0.35–487.91	1.0
1	323	5.15	0.36–51.29	1.0
2	6	9.33	4.38–15.88	1.0
3	5	6.72	6.44–11.97	1.0
5	1	14.14	14.14–14.14	1.0

Payload size is taken from the original torrent metainfo, excludes padding, and uses decimal GB. It describes advertised payload, not observed transferred bytes. Resolution, duration and file count confound language-pack size.

1. **Most classified torrents are monolingual:** 323 of 335 (96.4%). Only 12 contain two or more identified audio languages.
2. **Multilingual does not necessarily mean multiple files.** Median media-file count is 1.0 in each classified language-count group; additional tracks can be packaged in one container.
3. **The biggest packages are a coverage problem.** The unclassified-language group reaches 487.91 GB. A short probe of one file cannot describe a package of many matches.
4. **English subtitles are concentrated:** 47 of the 50 subtitle-classified torrents contain English. This is a property of the sampled supply, not a measure of viewer accessibility needs.

Inspect all 493 identities

The table includes the full canonical hash, title, six requested language indicators, and an explicit coverage label. “Not identified” includes absent, unknown, and unprobed tracks. Download the full CSV.

Sources, downloads, and counting rules

Full language indicators CSV · Shared inventory · Packaging calculations

All content joins use the shared inventory: **493 canonical BTIHA**, with verified hybrid-hash aliases. Alpha60 sampling began **June 29, 2026 — Round of 32**, and ends November 3 in this snapshot. Earlier-event media found later does not establish earlier sampling.

Geographic counts are **IP–torrent memberships**, with an IP counted once per canonical torrent and role within the stated interval. They are not unique people, viewing choices, completed downloads, transferred bytes, or ratings. An address can occur in both roles. Daily sums count the same membership again on another day.

Main geography uses **IPinfo and H3 resolution 8**, the highest resolution used here. The native minimum is **three downloaders per cell**; uploaders are retained only where that downloader threshold passes. Content comparisons filter each torrent separately. Overall country and city comparisons filter after aggregating torrents, so their totals differ. Country and city labels are representative locations within cells, and the finer grid does not improve IPinfo accuracy. Hosting, VPN, proxy and mobile flags overlap; each sensitivity exclusion is applied separately.

See the H3r8 manifest, generation and validation evidence, complete analytical reductions, and methods and coverage. Source hashes make the published snapshot inspectable.

Language and North American geography

Read the published page online

English-audio files circulate in Mexico. The seven identified Spanish-audio torrents do not support a stable positive geographic association with Spanish-speaking or Hispanic populations.

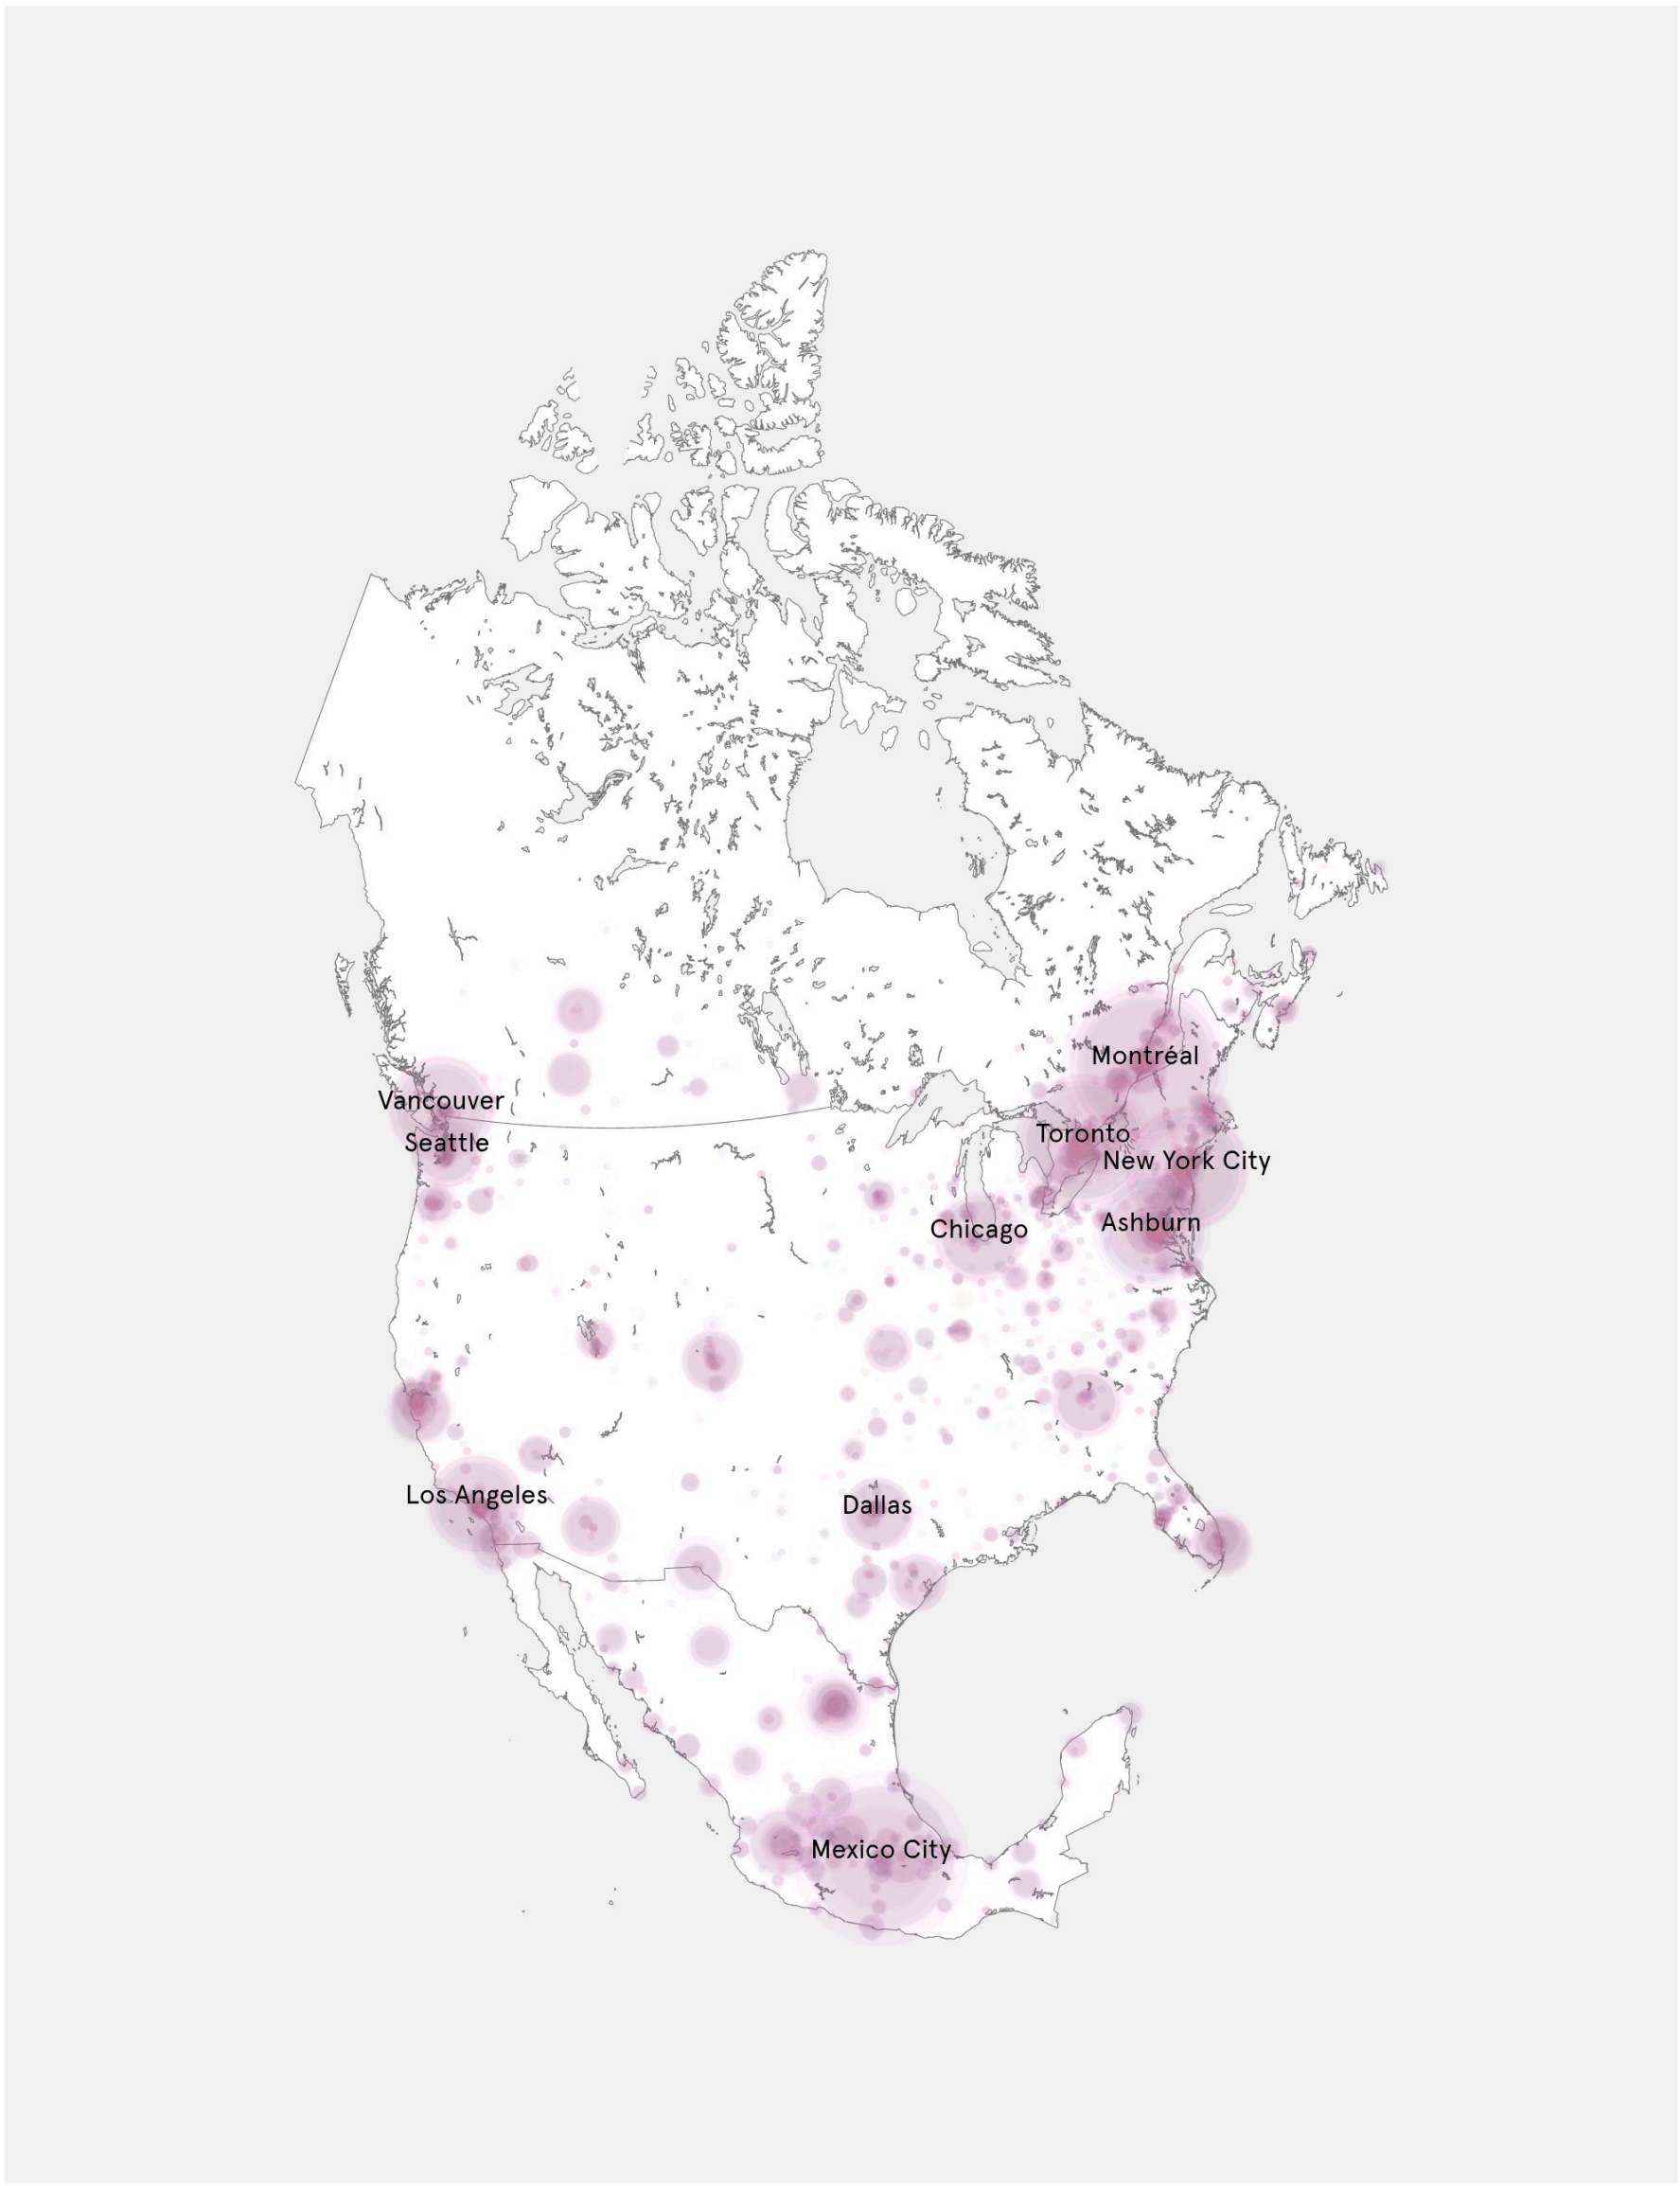

Spanish- and French-audio maps

USA, Canada and Mexico, excluding Alaska, Hawaii and the Western Aleutians. These plates select verified audio tracks and cover June 29–November 3, 2026. Circle area shows retained downloader IP–torrent memberships, including hosting networks; it does not measure viewers or which audio track was played.

Spanish-audio World Cup torrents

7 Spanish-audio torrents, including one 2002 replay · sampled June 29–November 3, 2026

Contiguous USA + Canada + Mexico · 106,543 retained IP–torrent memberships

Member colors: 2160 yellow/orange · 1080 pink/purple · 720 blue · SD green

Circle area ∝ downloader weight; shared radius coefficient 2.6; opacity 5%

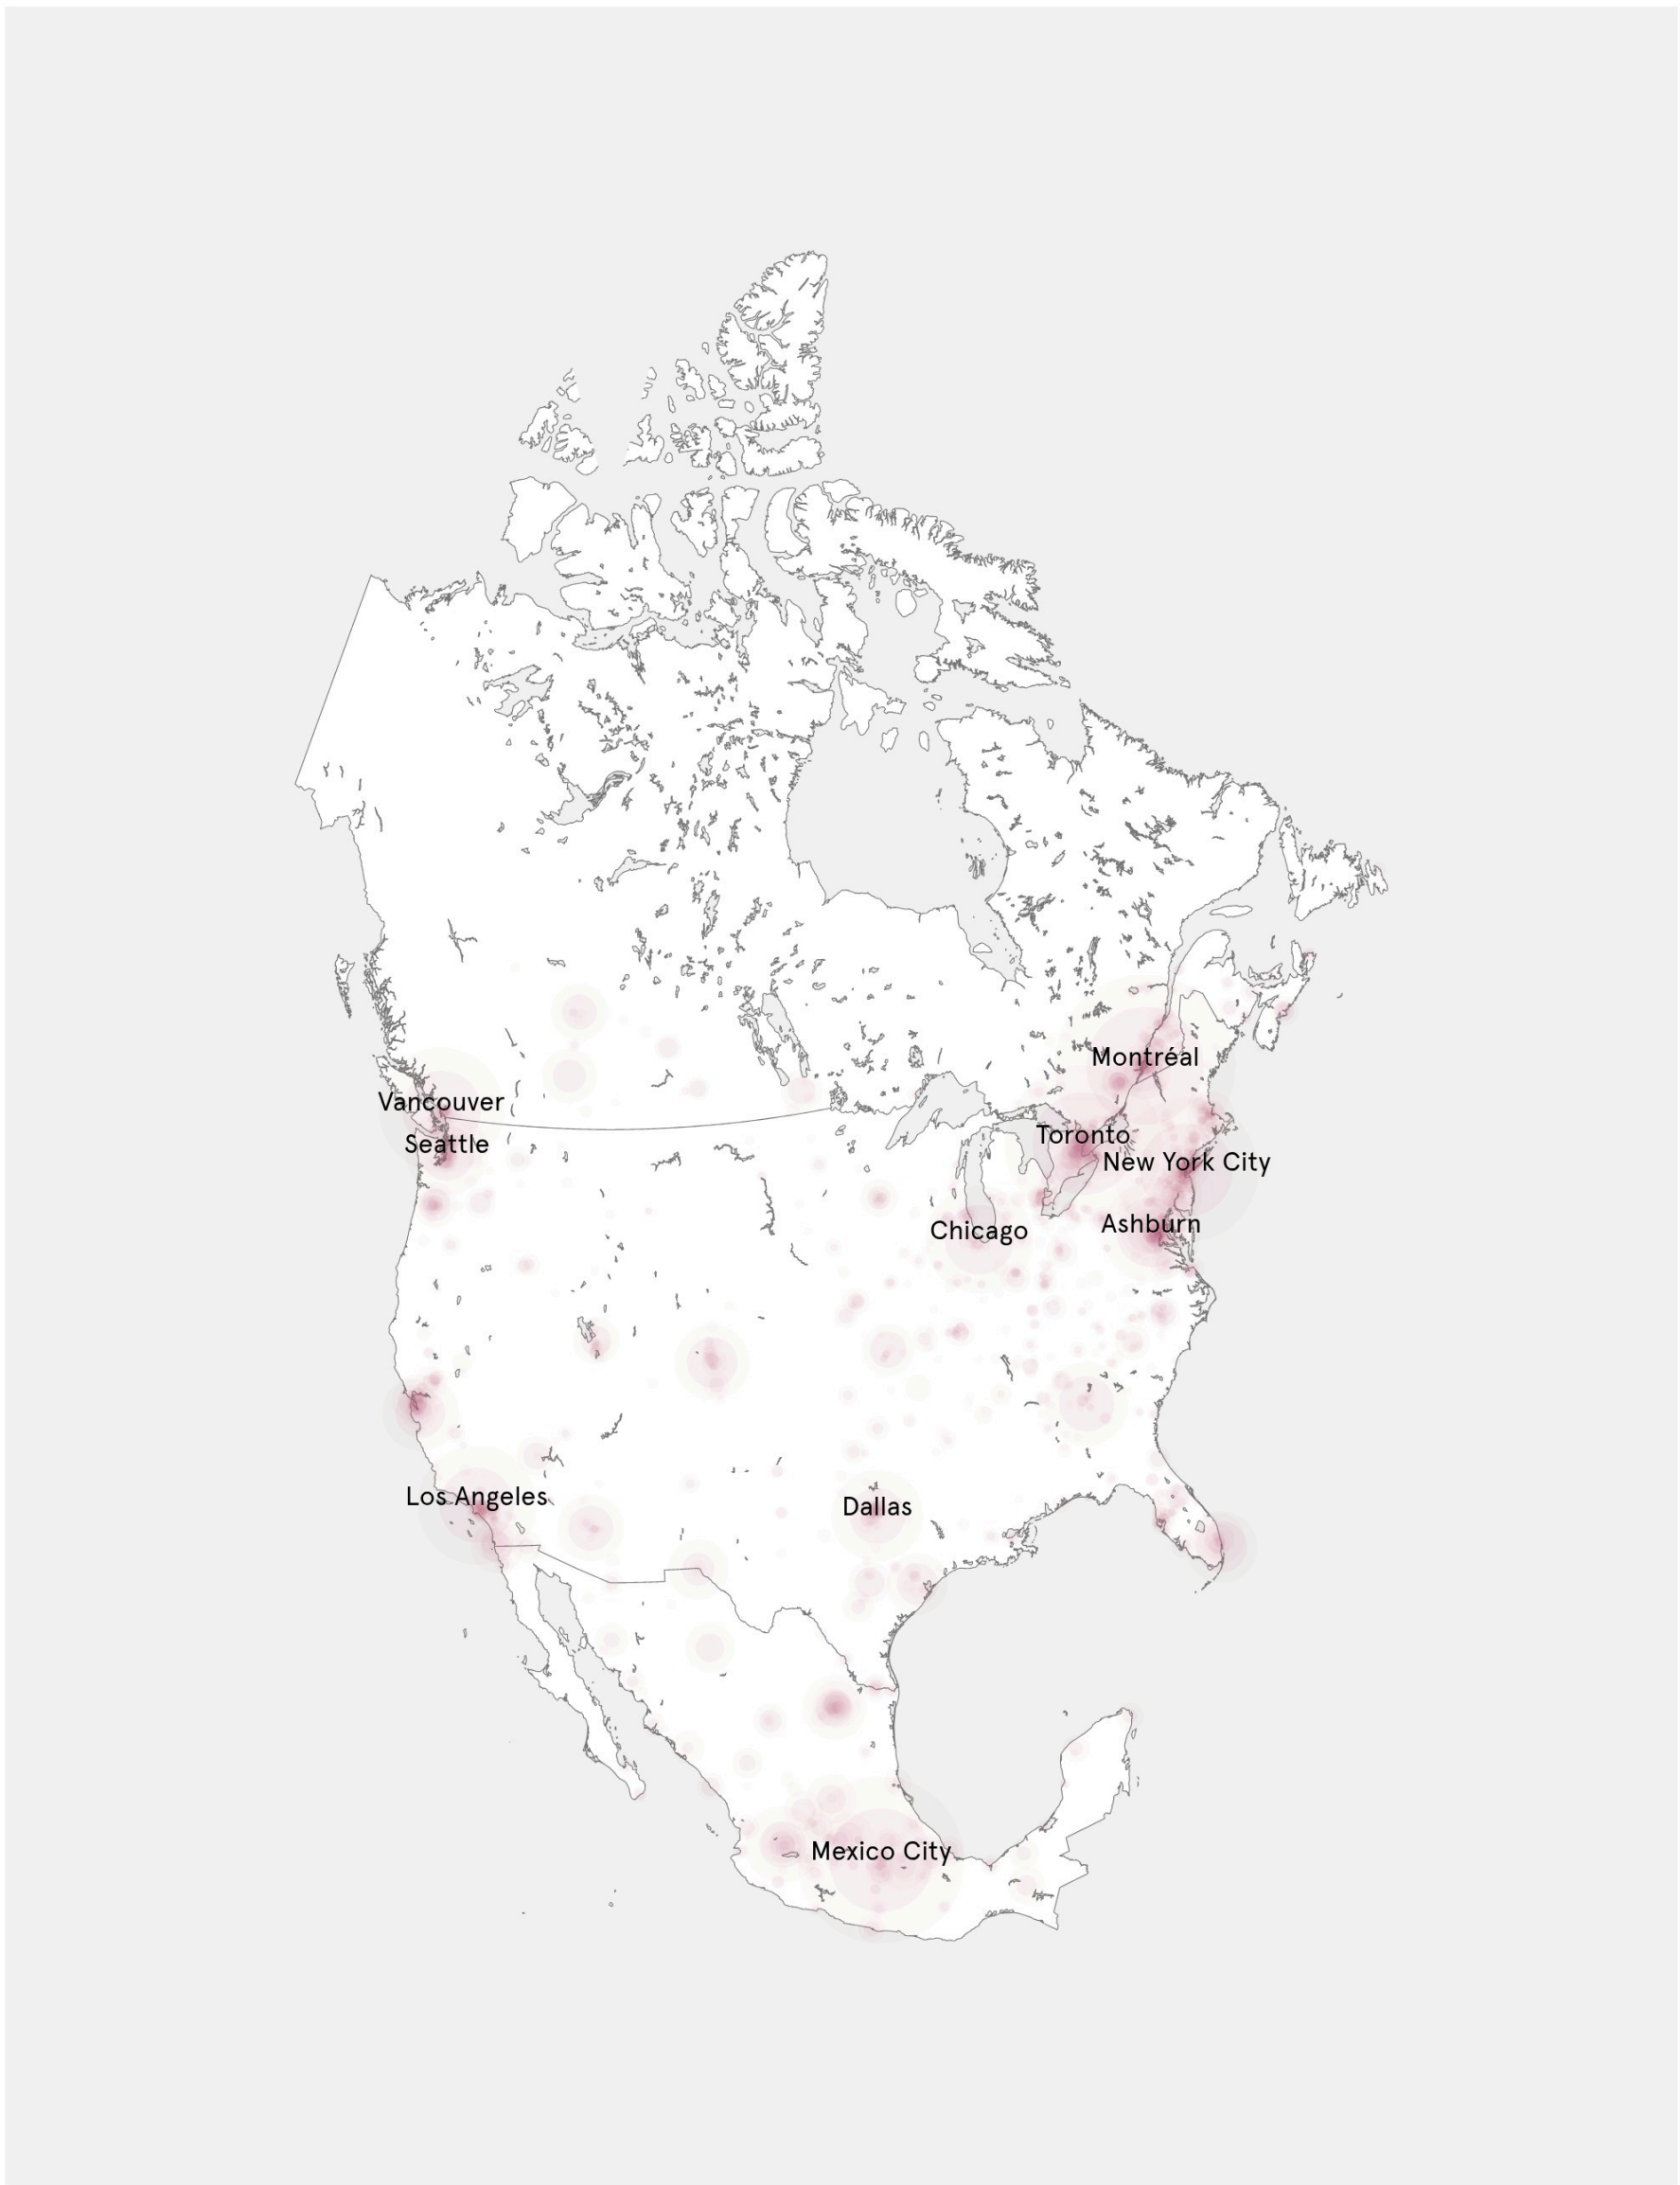

H3r8 source · country/city aggregates · no threshold-loss inflation · not viewers

Seven torrents, including the historical 2002 Spain–South Korea replay. 106,543 memberships: USA 56,568, Canada 28,283, Mexico 21,692. Full-size SVG · PNG · City counts · Selected geography

French-audio World Cup torrents

2 verified French-audio torrents · sampled June 29–November 3, 2026

Contiguous USA + Canada + Mexico · 34,516 retained IP–torrent memberships

Member colors: 2160 yellow/orange · 1080 pink/purple · 720 blue · SD green

Circle area ∝ downloader weight; shared radius coefficient 2.6; opacity 5%

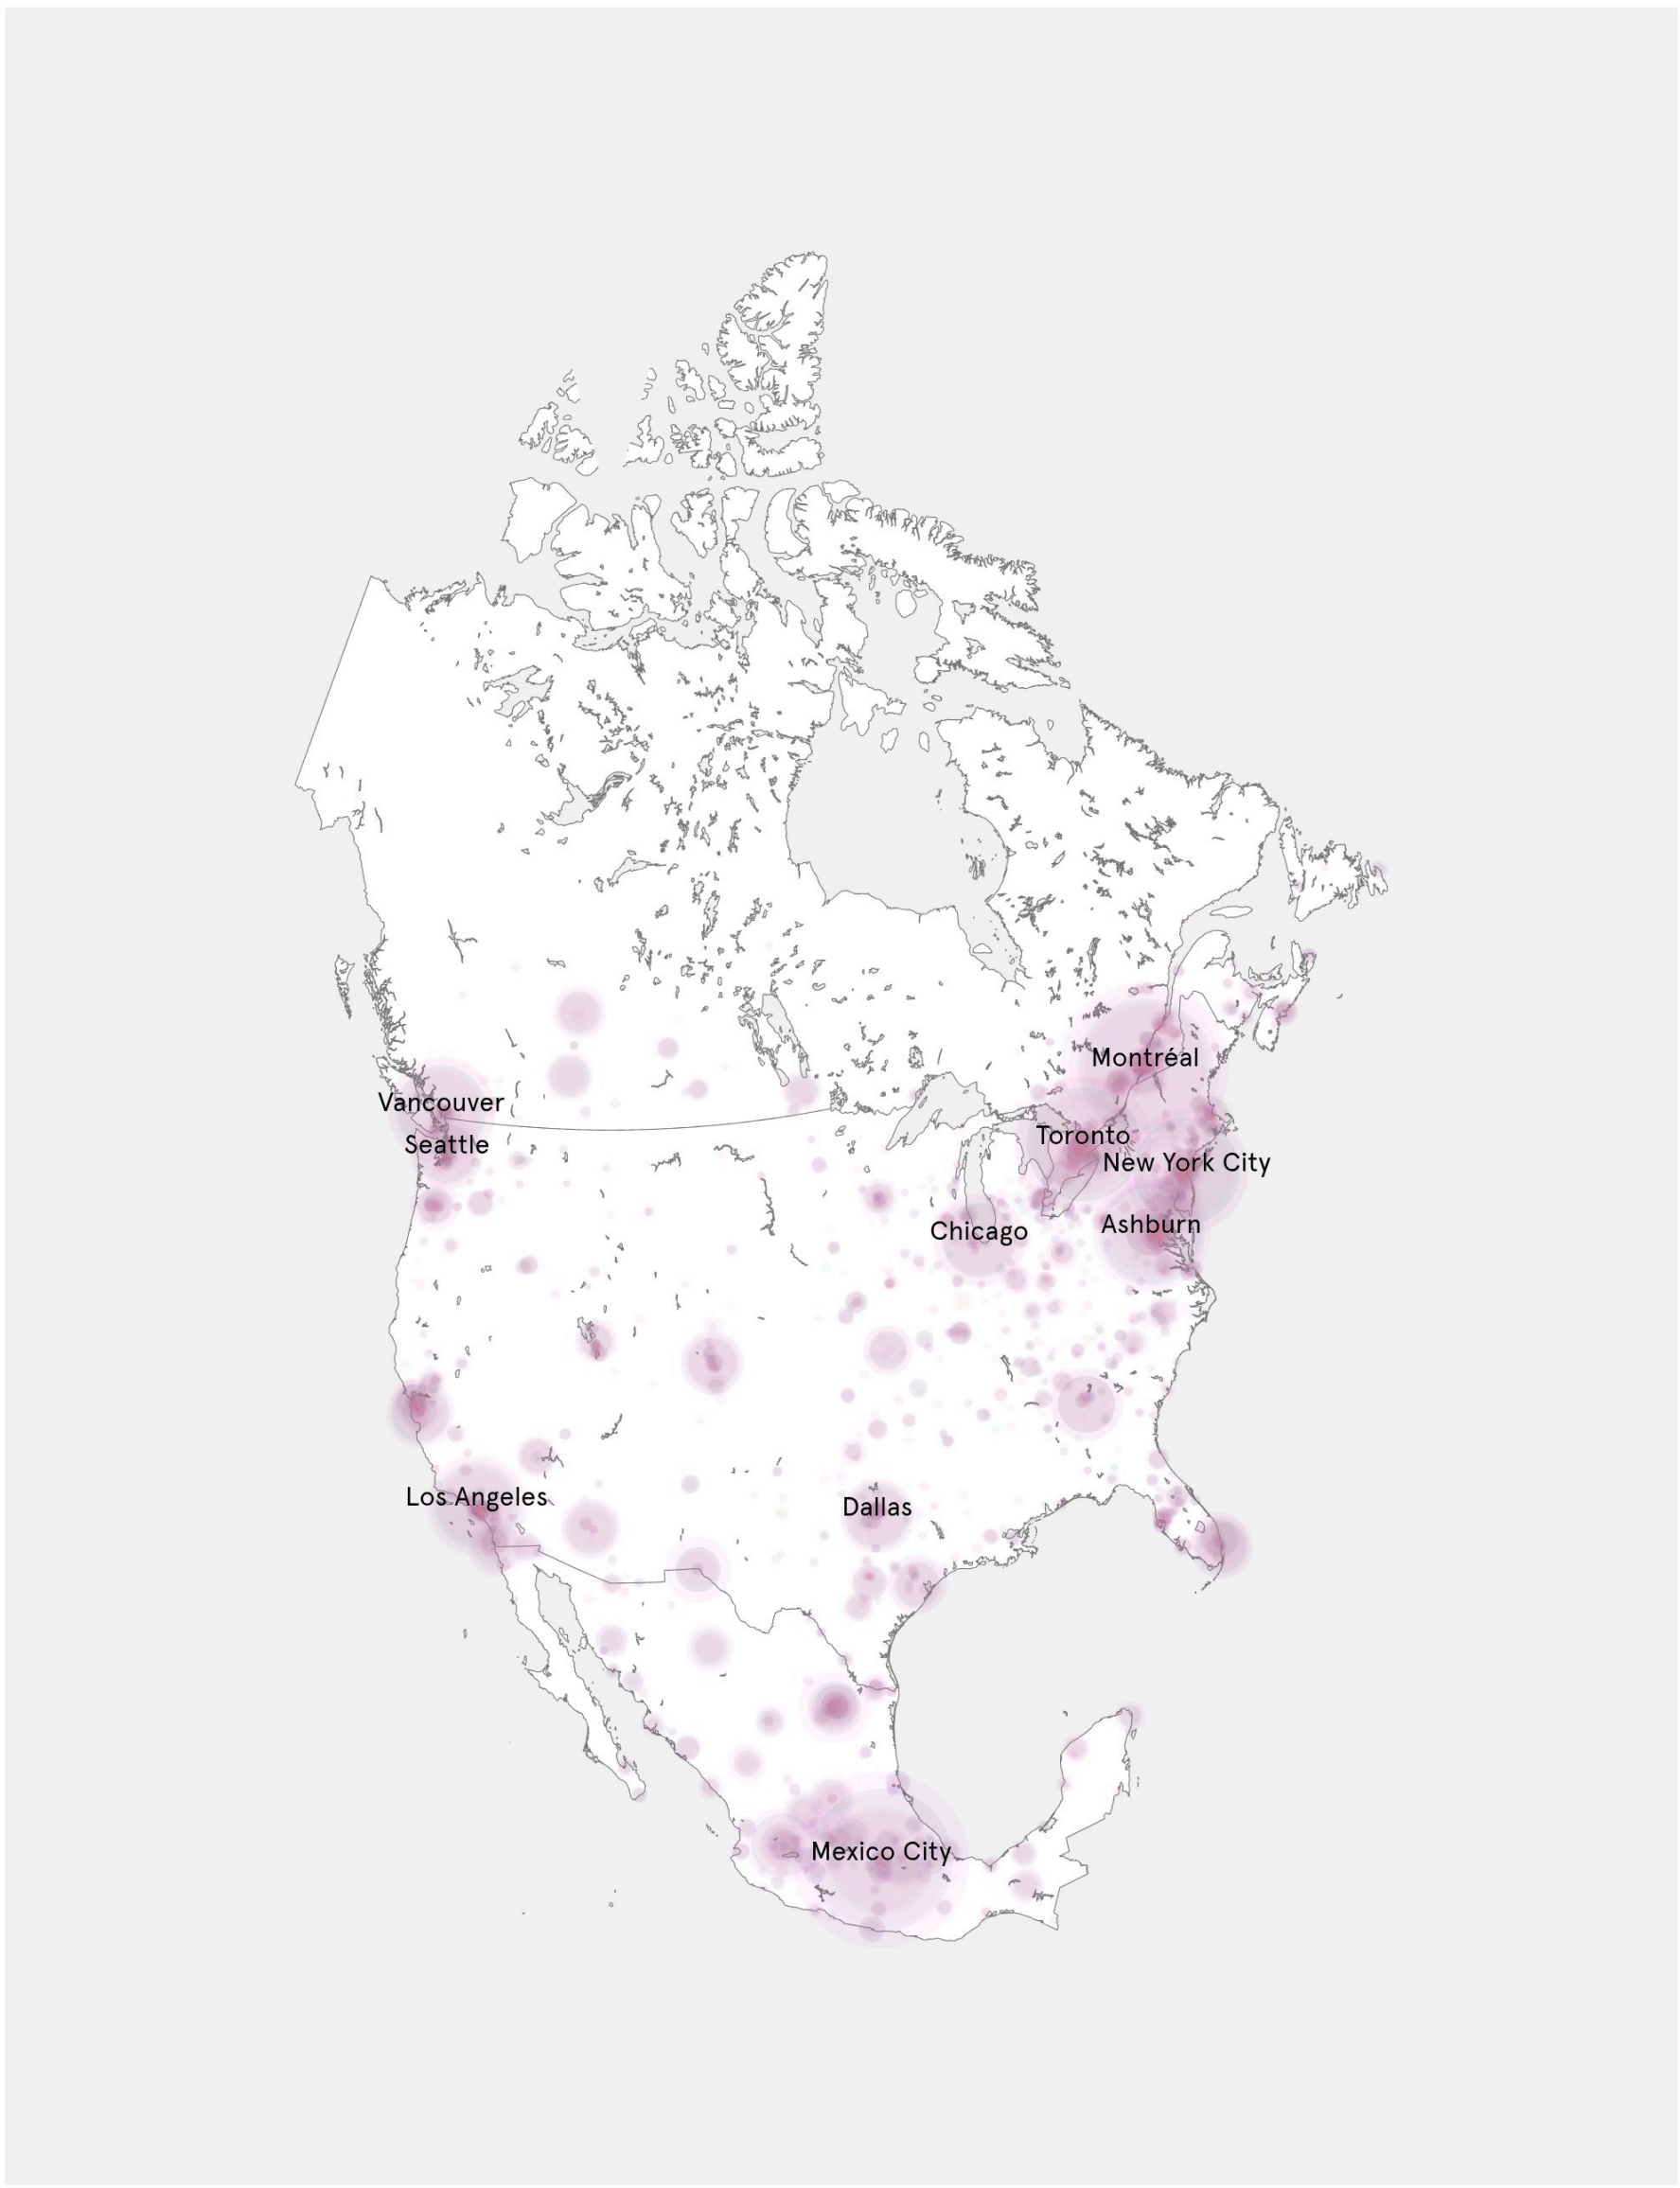

H3r8 source · country/city aggregates · no threshold-loss inflation · not viewers

Two verified French-audio torrents: South Africa–Canada and France–Sweden, both with M6 branding. 34,516 memberships: USA 18,513, Canada 9,467, Mexico 6,536. Full-size SVG · PNG · City counts · Selected geography

Spanish-audio World Cup torrents · 2026 only

6 verified Spanish-audio torrents · sampled June 29–November 3, 2026

Contiguous USA + Canada + Mexico · 88,933 retained IP–torrent memberships

Member colors: 2160 yellow/orange · 1080 pink/purple · 720 blue · SD green

Circle area ∝ downloader weight; shared radius coefficient 2.6; opacity 5%

H3r8 source · country/city aggregates · no threshold-loss inflation · not viewers

Six torrents, excluding the 2002 replay. Geography, circle-area scale and torrent colors match the seven-torrent plate. 88,933 memberships: USA 47,184, Canada 23,754, Mexico 17,995. Full-size SVG · PNG · City counts · Selected geography

The maps use the native Cahill–Keyes projection and country/city aggregates of H3r8 cells retained at a minimum of three downloaders per torrent. Suppressed cells are not restored. The country table below retains full national coverage, including Alaska and Hawaii in its U.S. totals. Torrent names, selection and source hashes · Map verification.

Where identified languages circulate

English-audio torrents are observed in Mexico, with 384,652 retained downloader memberships. This establishes distribution of files containing English audio; it cannot establish whether anyone listened to that track, spoke English, or watched the match.

D = retained IP–torrent downloader memberships; per-torrent H3r8 threshold

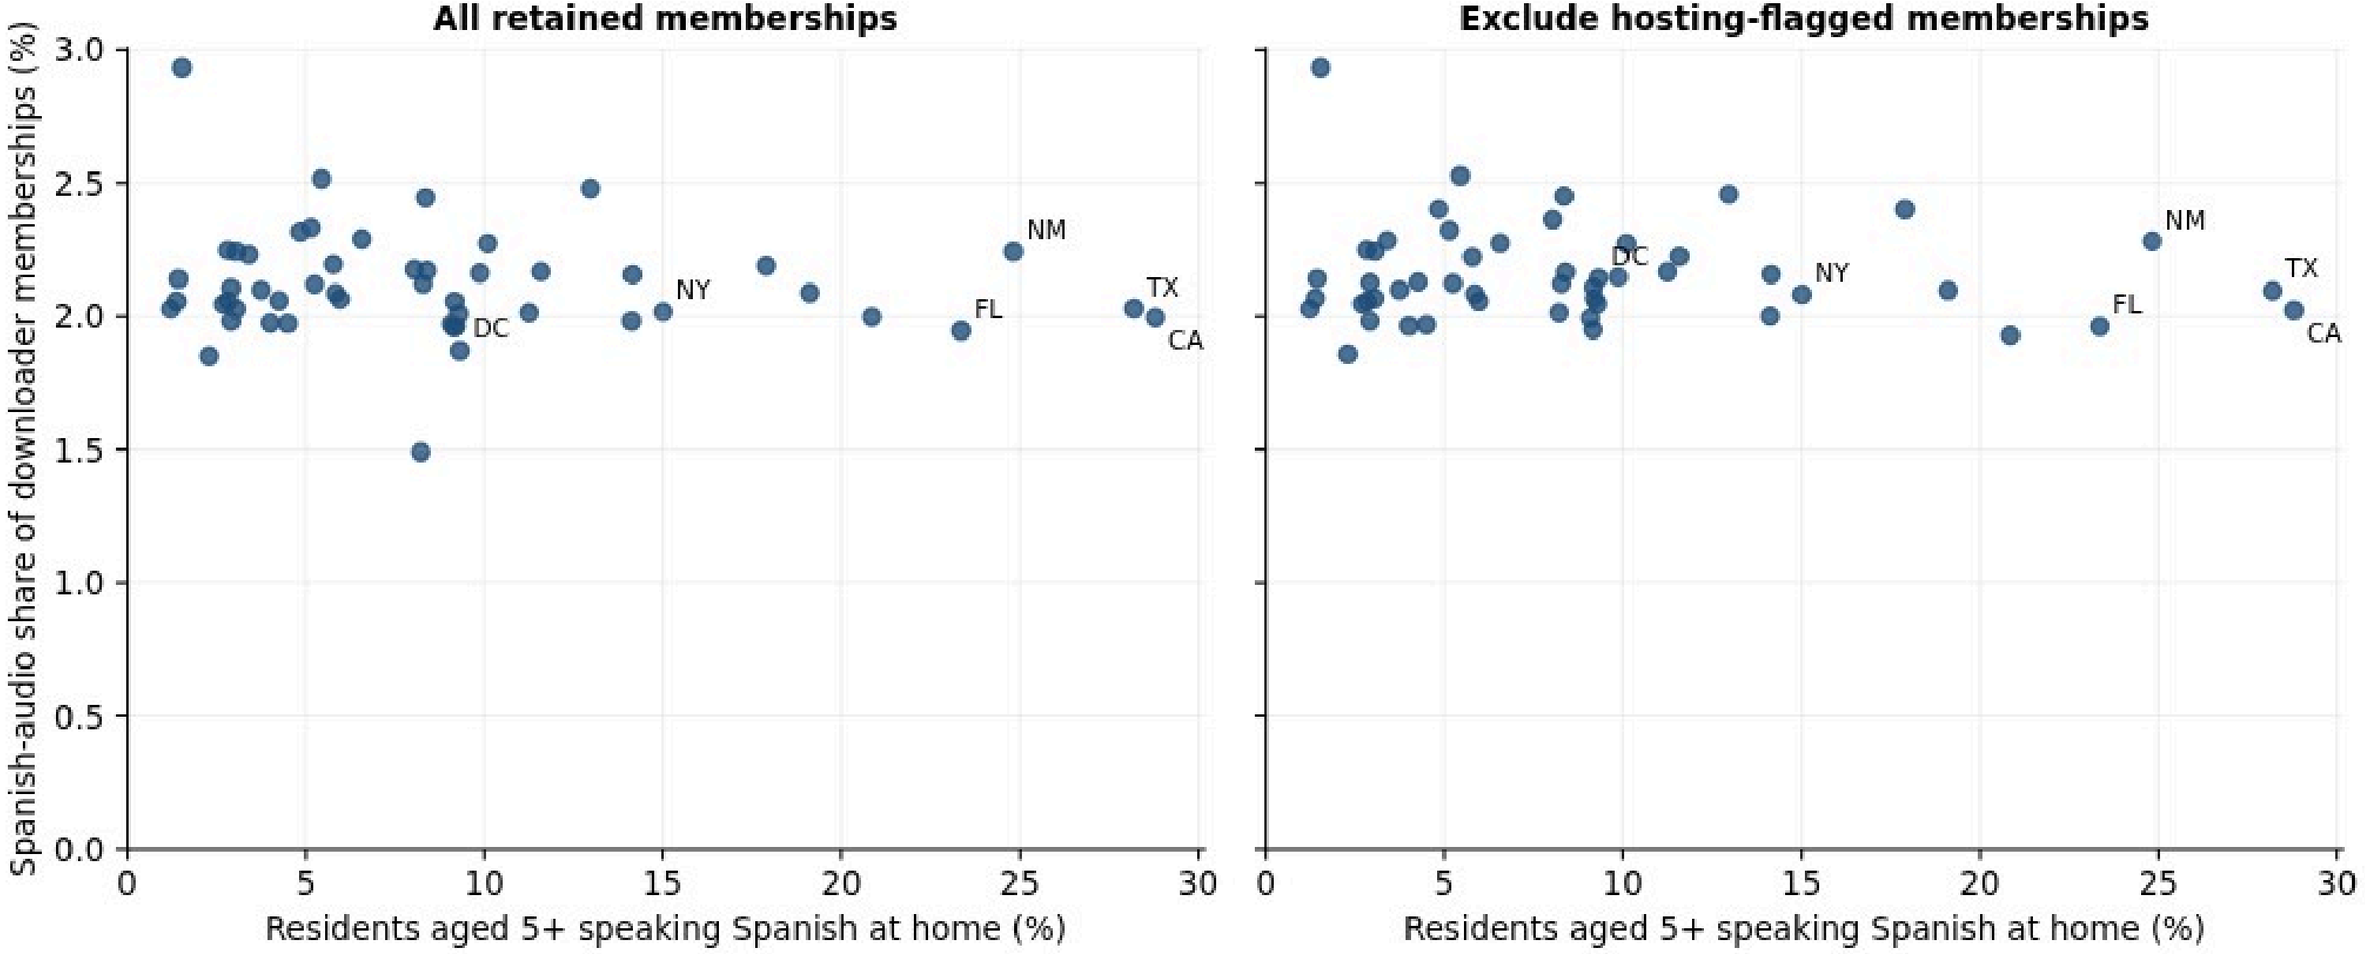

Country	All torrents: D	EN: D	EN share	ES: D	ES share	FR: D	FR share
United States	2,881,163	1,092,583	37.9%	56,672	2.0%	18,553	0.6%
Mexico	1,023,951	384,652	37.6%	21,692	2.1%	6,536	0.6%
Canada	1,410,387	526,678	37.3%	28,283	2.0%	9,467	0.7%
Spain	1,533,258	569,327	37.1%	31,943	2.1%	9,623	0.6%
Argentina	413,361	155,806	37.7%	8,875	2.1%	2,452	0.6%
Colombia	165,975	62,597	37.7%	3,575	2.2%	974	0.6%
France	2,102,681	777,139	37.0%	42,334	2.0%	13,016	0.6%

Spanish-audio share is 2.1% in Mexico, 2.1% in Spain, and 2.1% in Argentina, versus 2.0% in the USA and Canada. These differences are small compared with the coverage limitation: **only seven Spanish-audio torrents and two French-audio torrents are identified**. Unknown-language torrents remain in each country's denominator. The categories overlap because one torrent may contain several languages.

Does Spanish-audio distribution track US language or ethnicity?

We joined IPinfo's GeoNames city identifiers to its state fields, then compared state aggregates with **2024 ACS one-year estimates**. Language is Spanish spoken at home among residents aged five or older (`C16001`); ethnicity is Hispanic or Latino origin among residents of all ages (`B03003`). The two measures are analyzed separately. These are ecological comparisons across 50 states and DC, not classifications of peers. ACS tables and documentation

Excluded network flag	Census measure	Spearman rho	Leave-one-Spanish-torrent-out range
none	Spanish at home	-0.117	-0.238 to 0.079
none	Hispanic / Latino origin	-0.132	-0.265 to 0.047
hosting	Spanish at home	0.010	-0.118 to 0.102
hosting	Hispanic / Latino origin	-0.007	-0.149 to 0.073
vpn	Spanish at home	-0.025	-0.153 to 0.082
vpn	Hispanic / Latino origin	-0.042	-0.178 to 0.055
proxy	Spanish at home	-0.112	-0.237 to 0.084
proxy	Hispanic / Latino origin	-0.127	-0.264 to 0.051
mobile	Spanish at home	-0.083	-0.227 to 0.117
mobile	Hispanic / Latino origin	-0.114	-0.270 to 0.071

Each point is a state or DC. Census language measures describe residents; torrent shares describe observed distribution. ACS uncertainty and shared matches among torrent versions prevent an independence-based significance claim. Open full-size chart (SVG).

The association is **not a stable positive one**: the unfiltered network comparison has rho −0.118 for Spanish at home and −0.132 for Hispanic origin. Removing hosting flags moves both close to zero. Omitting one of the seven Spanish-tagged torrents can change the sign. These are descriptive sensitivity results, not confidence intervals or a population hypothesis test. ACS margins of error are retained in the downloadable data but are not propagated into these coefficients.

Canada and Mexico require different demographic definitions

Quebec accounts for **38.6% of Canadian French-audio memberships**, compared with **38.5% of all Canadian memberships**. This sample offers little French-specific geographic concentration. In Canada's 2021 census, French alone is the language most often spoken at home for 77.5% of Quebec's population under the table's undistributed multiple-response definition. That resident measure is not the same denominator as Quebec's share of Canadian torrent memberships. Statistics Canada, table 15-10-0033-01

The Canadian table groups non-official languages and does not supply a Spanish-only provincial comparison here. US Hispanic-origin categories are not transferred to Canada or Mexico. No quantitative claim about a "high Latino population" area outside the USA is made without a compatible local measure.

Findings and improvements

1. **Language-bearing files cross national language boundaries.** English-tagged files circulate in Mexico; this does not reveal listening behavior.
2. **Spanish-specific regional enrichment is weak in the identified sample.** Country shares cluster near 2.0%, and the state association is sensitive to network flags and individual torrents.
3. **French supply is too sparse for strong market conclusions.** Two identified torrents cannot represent the Canadian or French-language broadcast market.
4. **Prioritize better supply coverage and match controls.** Probe every file and every audio/subtitle track, deliberately monitor Spanish and French release sources, record discovery time, and compare versions of the same match over the same observation age. Add compatible Canadian Spanish-language and Mexican language measures before extending the demographic analysis.

WORLD CUP 2026 · STAGE ONE · NOVEMBER 6, 2026

North America and two knockout matches

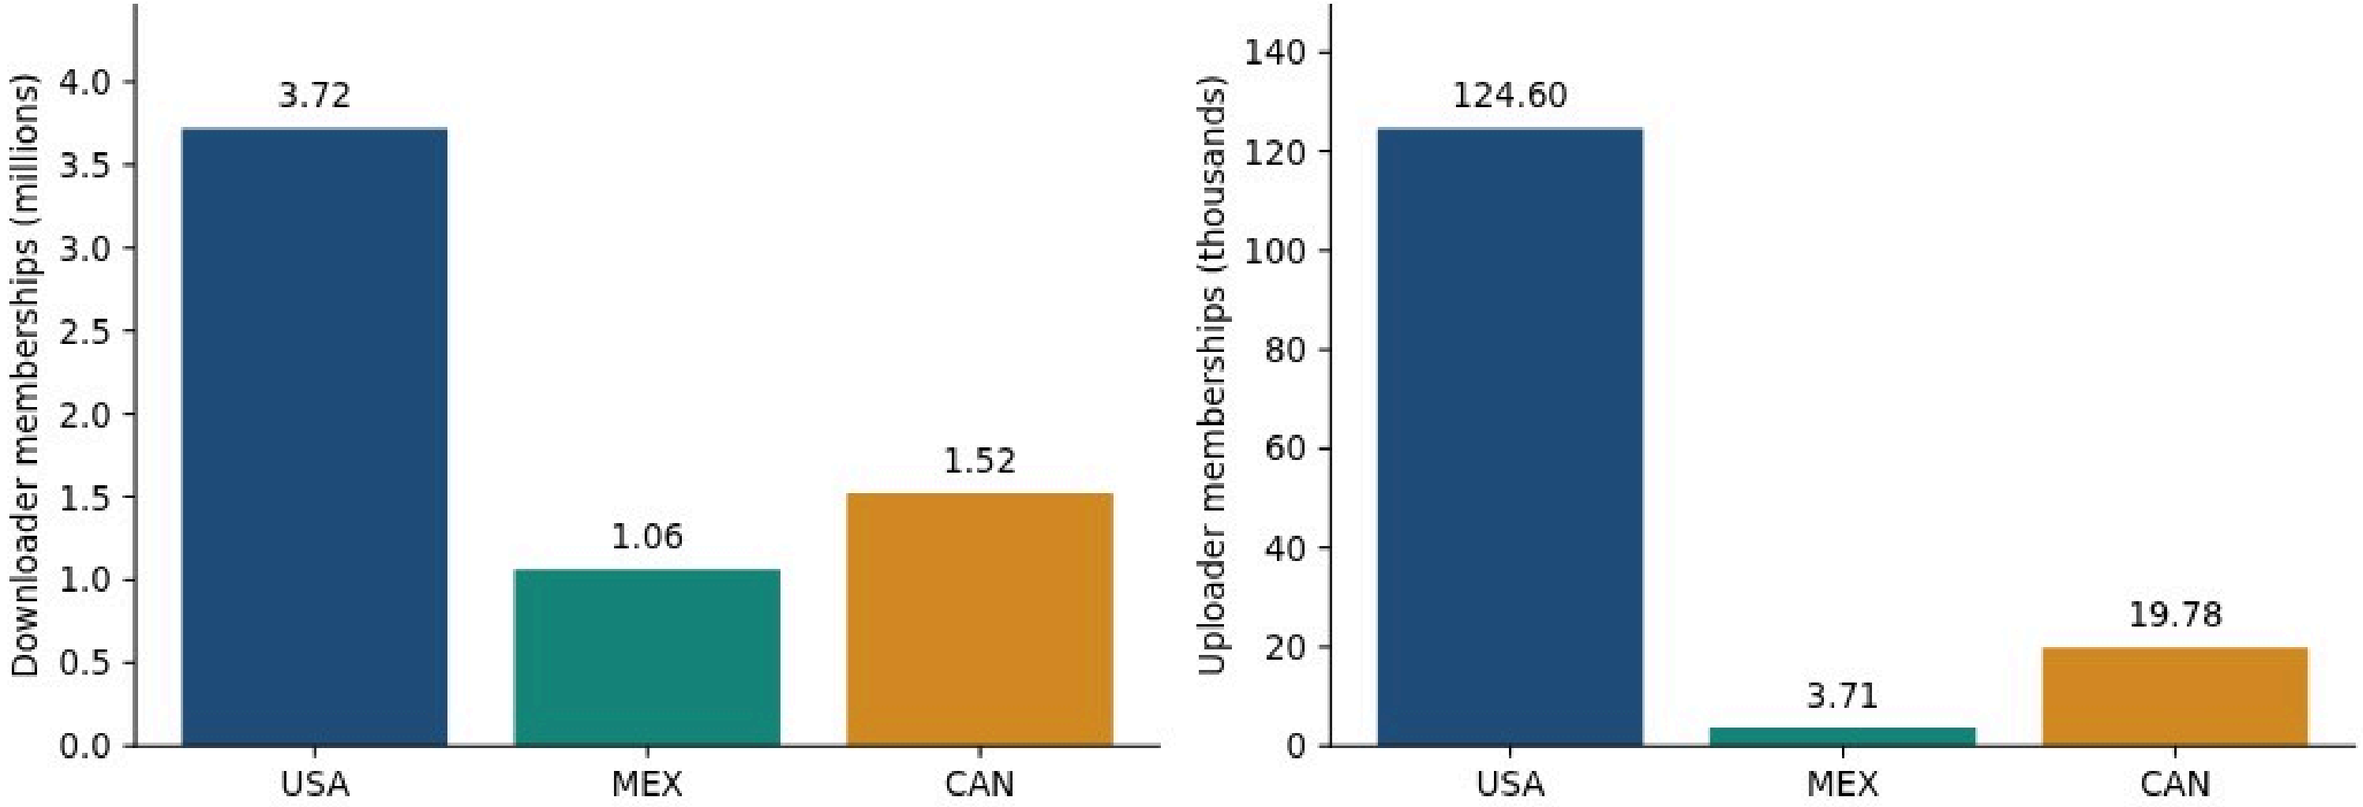

Read the published page online

The USA leads the three hosts in observed memberships. Equal-age windows show different downloader and uploader patterns for USA–Belgium and Mexico–England.

Overall observed distribution

The USA has the largest observed downloader and uploader membership totals among the three hosts. Canada exceeds Mexico on both roles in this sample. These totals describe sampled peer-to-peer distribution through November 3, including the post-tournament tail; they are not television audiences.

Location	Downloader memberships	World share	Uploader memberships	World share
United States	3,718,099	6.6%	124,603	23.1%
Mexico	1,061,746	1.9%	3,711	0.7%
Canada	1,522,492	2.7%	19,782	3.7%
World	56,407,686	100.0%	539,629	100.0%

Cumulative June 29–November 3; H3r8 aggregate threshold. The two panels have different units and scales. Memberships can repeat across torrents and roles. Open full-size chart (SVG).

Are the host countries unusually hosting-heavy?

High hosting shares are common across these sampled media objects. World Cup downloader shares are lower than all three comparators in the USA and Canada. In the first 14 collection days, US hosting shares are 56.6% for World Cup, 68.2% for Crew Girl, 65.5% for Dan Da Dan, and 73.6% for Kung Fu Soccer. Canada's corresponding shares are 39.0%, 47.6%, 51.1%, and 43.9%. Mexico stays much lower, at 0.7%–5.4% across the four collections.

These comparisons align **collection observation age**, not release time, broadcast time or torrent discovery age. Each total sums daily memberships; it is not a unique 14-day population. Series, films and a tournament have different catalogs, audiences, discovery paths and observation dates. H3r8 and the same frozen IPinfo inputs are used throughout.

Observation windows and unequal catalog coverage

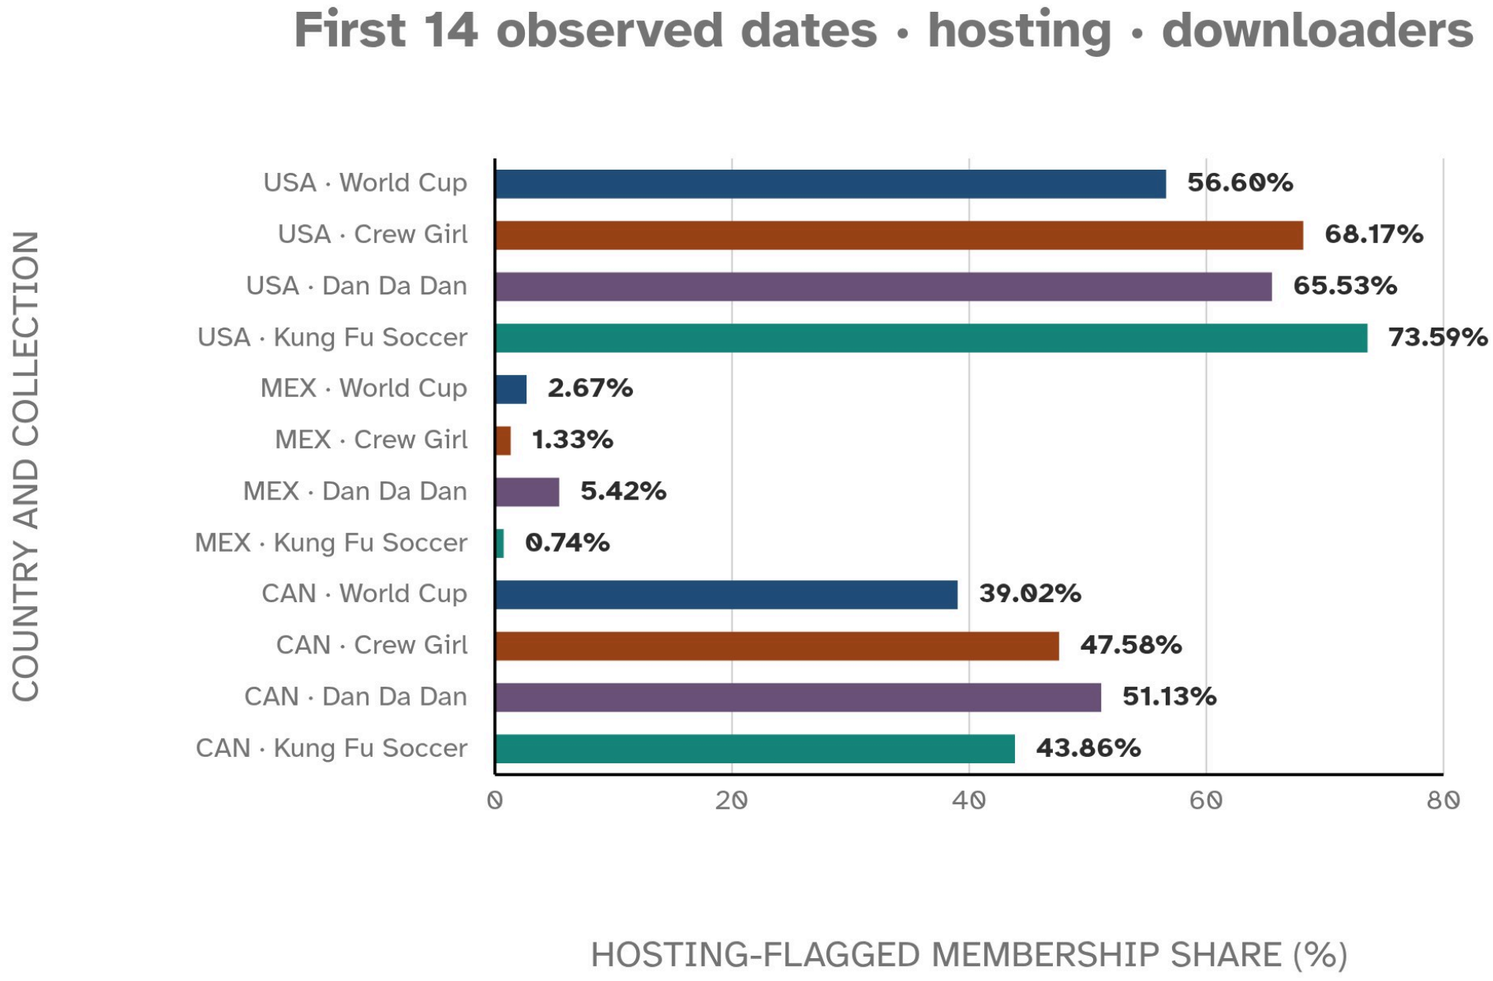

Collection	First 14 observed dates	Canonical catalog	Daily cached catalog range	Scope
World Cup	2026-06-29 to 2026-07-12	493	2–323	June 29 — Round of 32; all sampled World Cup media
Crew Girl	2026-09-10 to 2026-09-23	195	153–195	Season one; eight episodes and packs; final sample-date metainfo
Dan Da Dan	2025-09-04 to 2025-09-17	301	14–145	Season two episodes 10–12 and season packs; not the whole franchise
Kung Fu Soccer	2026-10-03 to 2026-10-16	35	12–34	Film release collection

Why the full-snapshot city tables look different

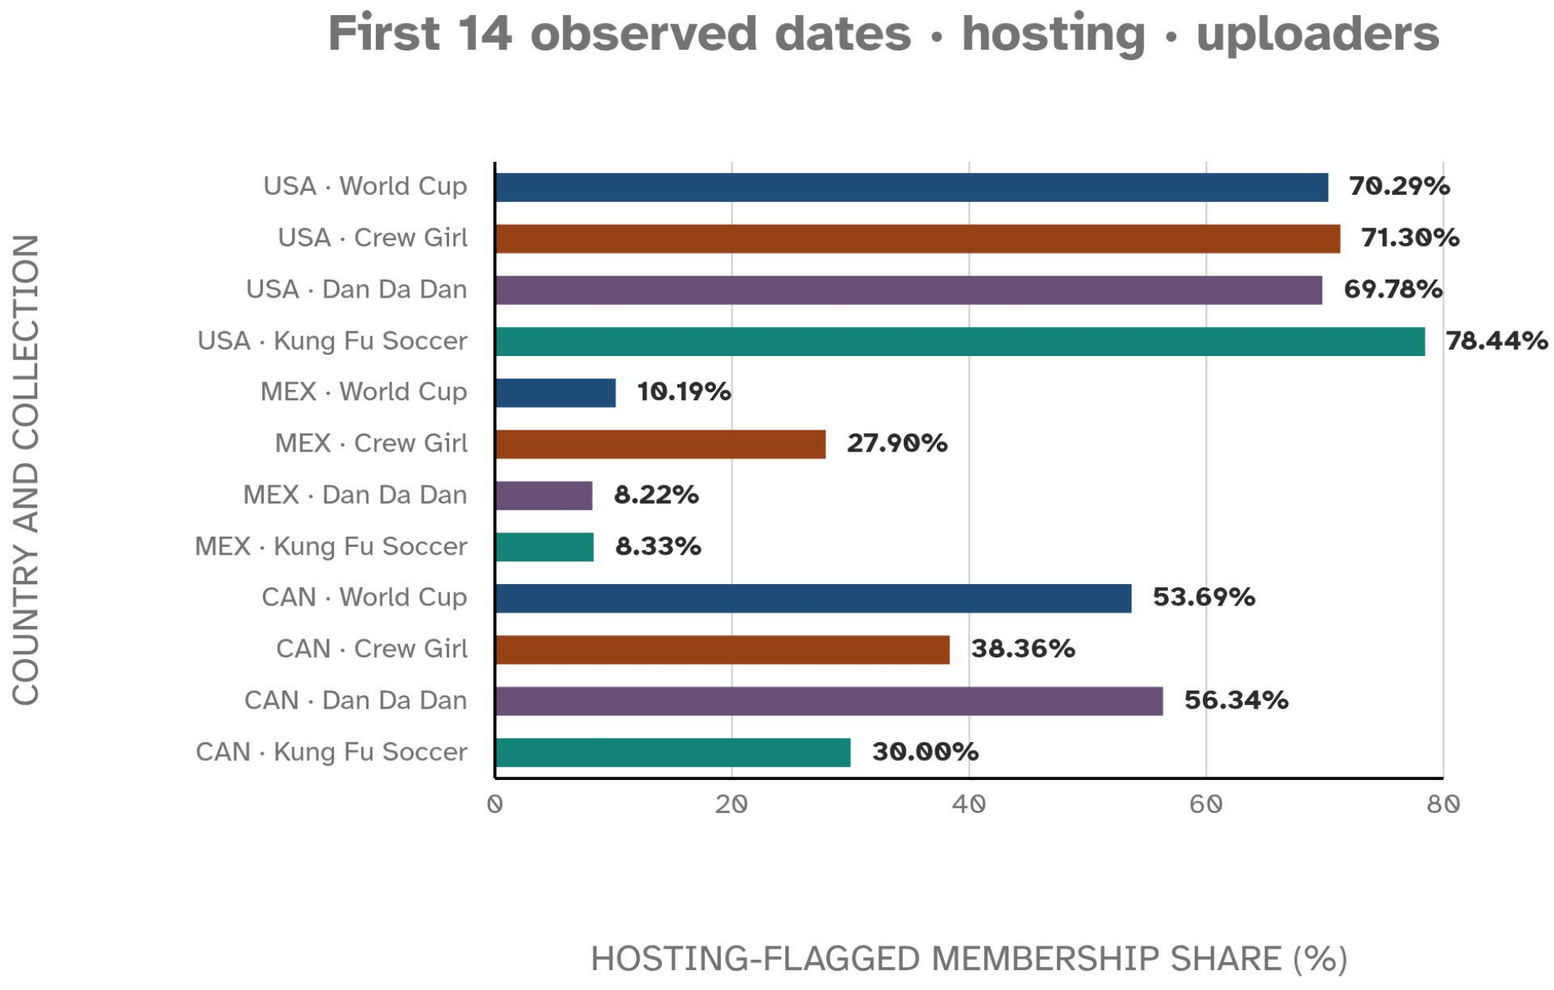

The existing location rankings above and below cover June 29–November 3, and some top locations are hosting hubs. Their individual percentages should not be read as countrywide shares. The whole-country cumulative figures are:

Country	Cumulative D	D hosting	Cumulative U	U hosting
United States	3,718,099	33.2%	124,603	76.5%
Mexico	1,061,746	1.0%	3,711	14.0%
Canada	1,522,492	21.7%	19,782	51.8%

The comparisons that follow use the first 14 dates for every object. They should not be substituted for those full-snapshot totals.

Within-country shares, first 14 collection dates; H3r8 daily aggregate memberships. Four collections share one zero-based scale. Flags can overlap. Open full-size izzi chart (SVG). Chart values and rendering specification (JSON).

Within-country shares, first 14 collection dates; H3r8 daily aggregate memberships. Four collections share one zero-based scale. Flags can overlap. Open full-size izzi chart (SVG). Chart values and rendering specification (JSON).

US uploader shares are high in all four collections: 70.3% World Cup, 71.3% Crew Girl, 69.8% Dan Da Dan and 78.4% Kung Fu Soccer. Canada varies more: 53.7%, 38.4%, 56.3% and 30.0%. Mexico's Crew Girl uploader share is 27.9%, compared with World Cup's 10.2%, but it rests on only 362 daily memberships. Kung Fu Soccer has only 36 Mexican uploader memberships; three flagged memberships produce its 8.3% hosting share.

VPN, mobile, satellite and the other network flags

Dan Da Dan has the strongest VPN signal in the USA and Canada: 51.1% and 51.2% of downloader memberships, versus World Cup's 26.0% and 27.2%. Its uploader shares are 62.4% and 61.2%. Hosting and VPN can describe the same address, so these columns cannot be added or subtracted as exclusive categories.

Canadian mobile downloader shares are similar across the collections, at 8.6%–10.0%, compared with 1.4%–3.1% in the USA and 0.3%–0.6% in Mexico. Satellite downloader flags remain below 0.6%. Uploader percentages for rare flags are sensitive to small denominators; the exact counts remain downloadable.

Does country mix explain the pooled result?

Pooling the three countries changes the comparison because each collection has a different country mix. Applying **World Cup's first-14-day country weights separately for each role** gives a common mixture. Uploader hosting shares then converge near 63.0% for World Cup, Dan Da Dan and Kung Fu Soccer; Crew Girl is 61.1%. Downloader differences remain. This adjustment controls country composition only.

downloaders · USA, Mexico and Canada

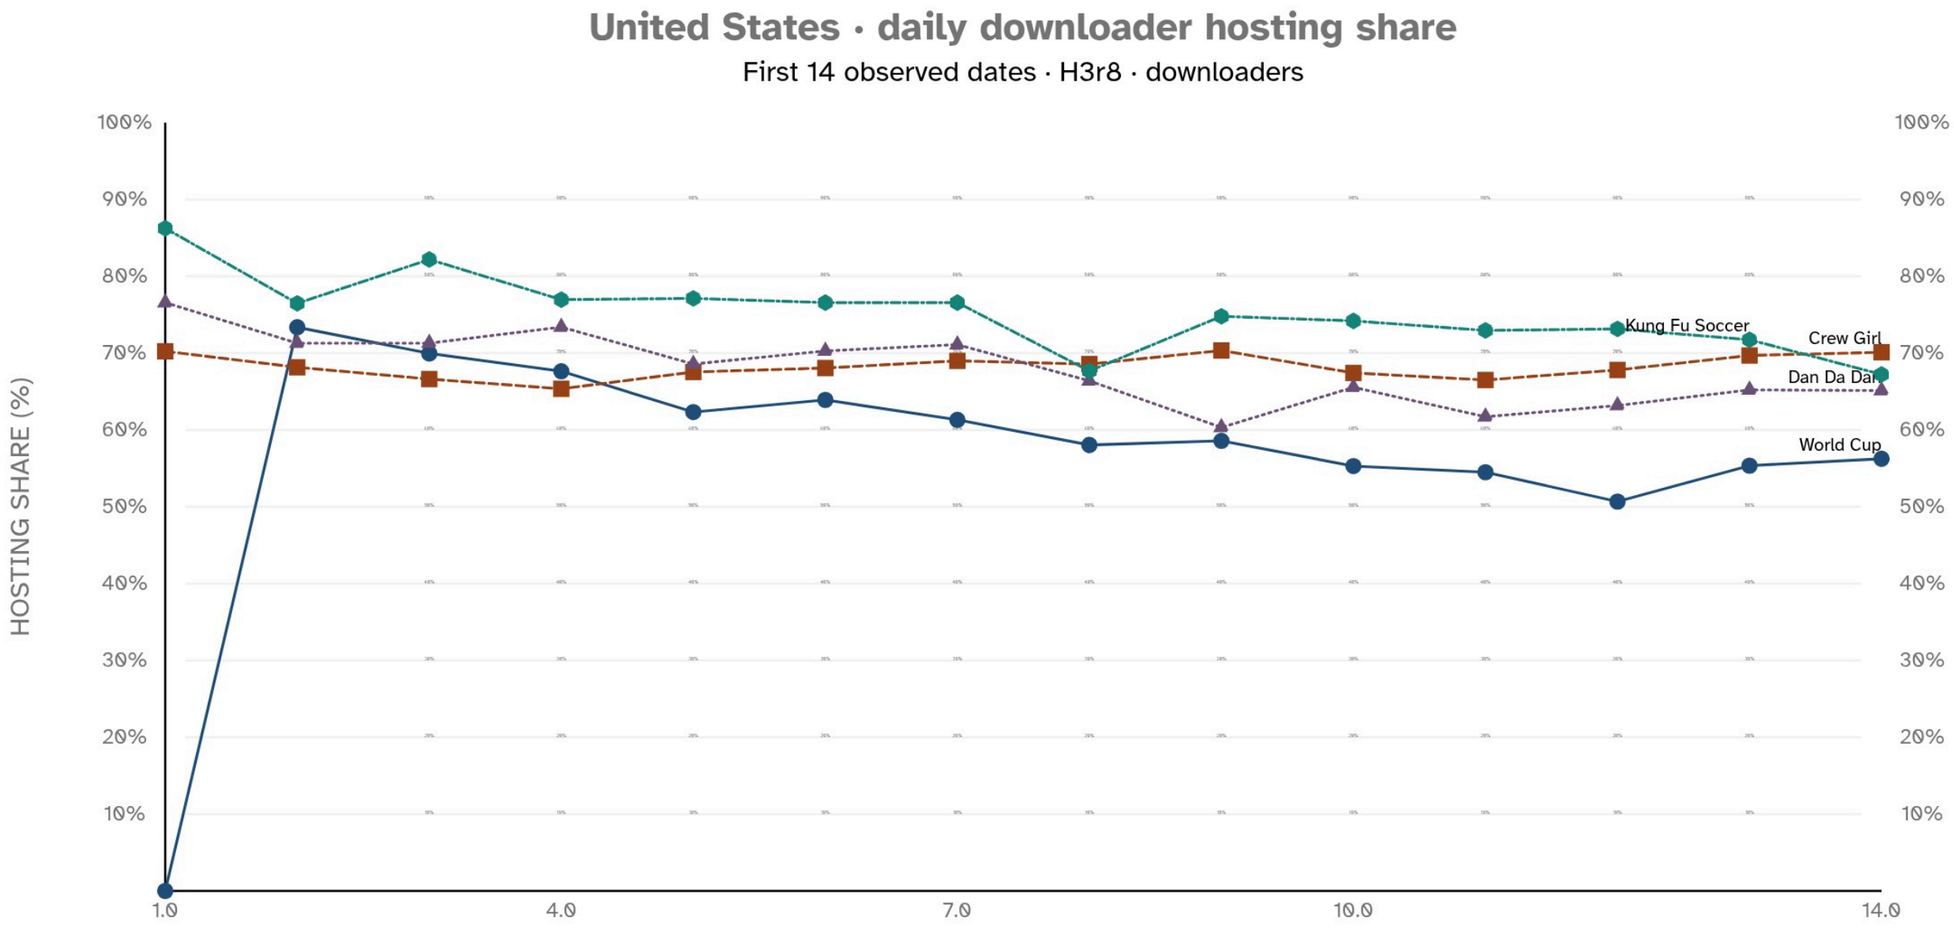

Collection	Pooled hosting	Common-country-weight hosting
World Cup	46.5%	46.5%
Crew Girl	54.7%	56.0%
Dan Da Dan	57.7%	55.6%
Kung Fu Soccer	55.7%	58.4%

uploaders · USA, Mexico and Canada

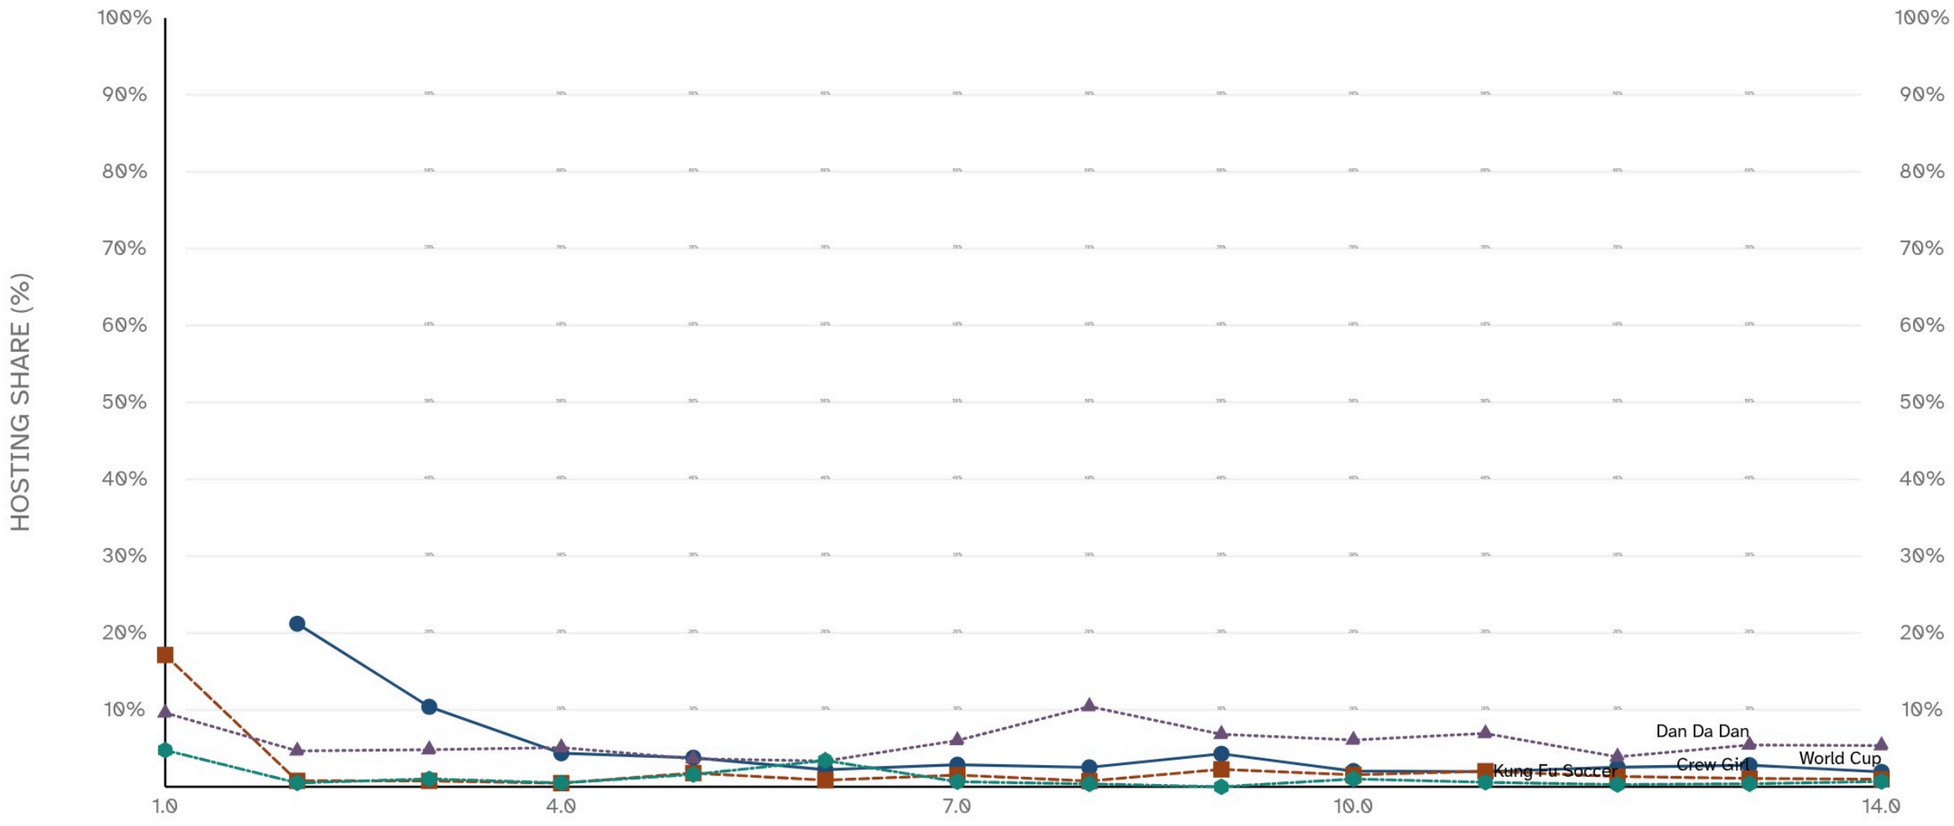

Collection	Pooled hosting	Common-country-weight hosting
World Cup	63.1%	63.1%
Crew Girl	63.1%	61.0%
Dan Da Dan	63.4%	63.2%
Kung Fu Soccer	68.1%	63.0%

Observation age, calendar dates and geography sensitivity

The age-aligned daily lines show how each collection changes within its own first 14 dates. Empty country-days are omitted, not converted into a zero rate. World Cup begins with only two cached torrents, making the earliest daily percentages especially sensitive to coverage. Different calendar dates remain a limitation.

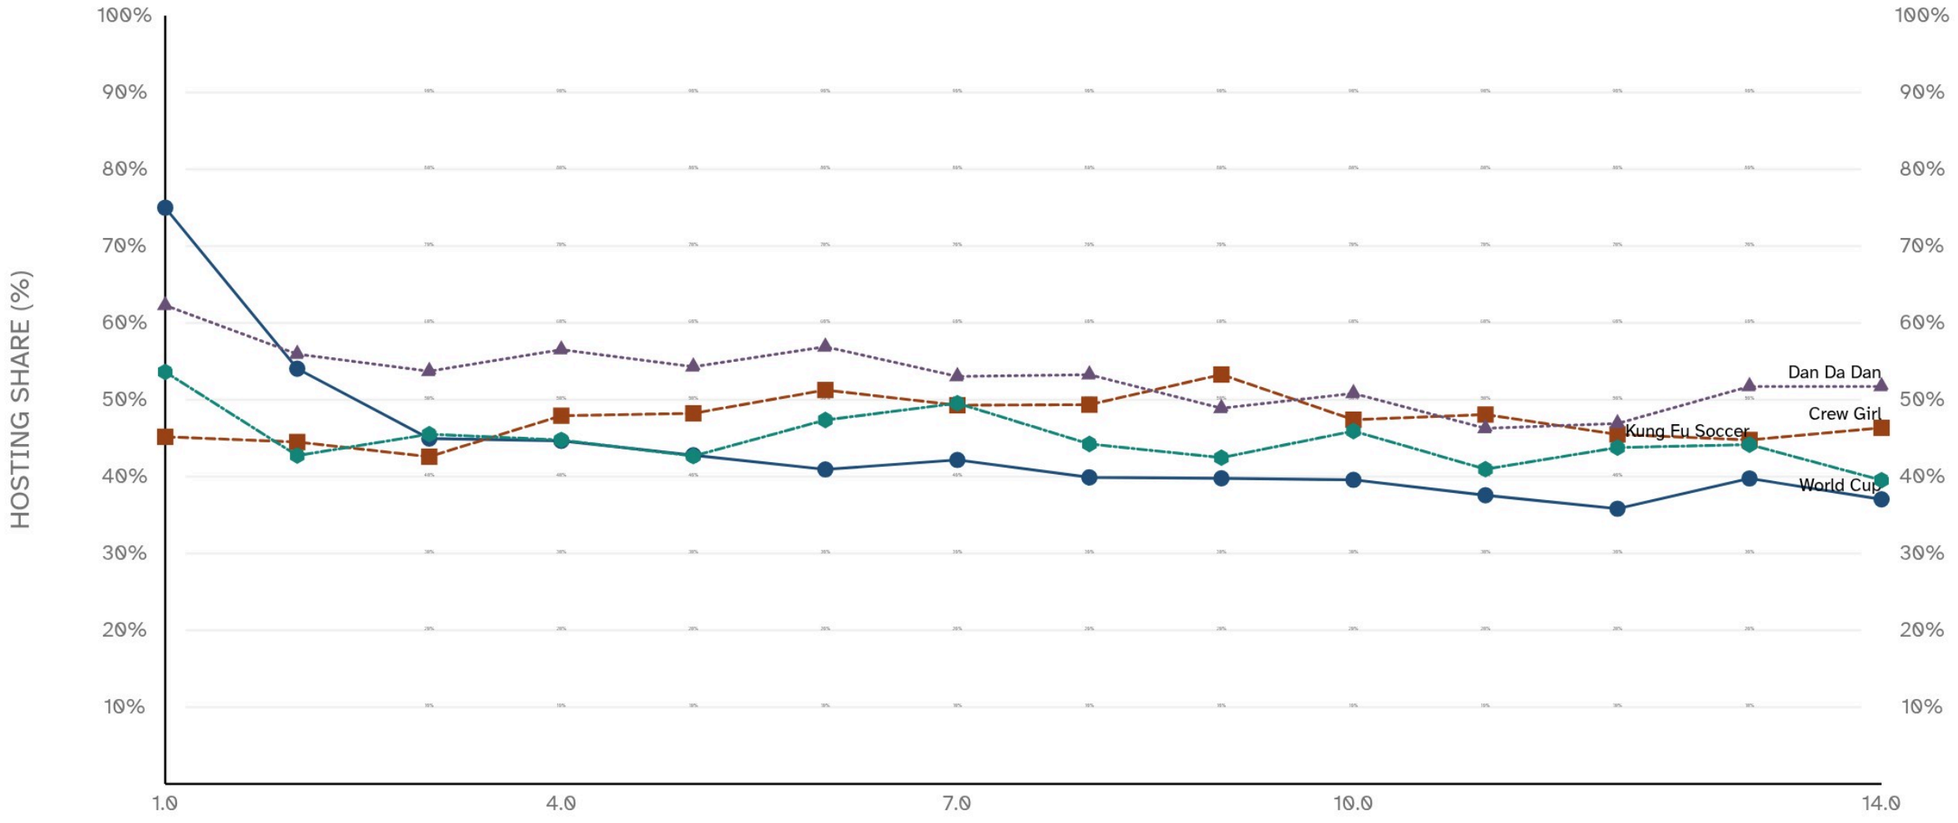

Collection age is aligned; release timing and torrent availability are not. Focus a line for exact daily values. Open full-size izzi chart (SVG). Chart values and rendering specification (JSON).

Collection age is aligned; release timing and torrent availability are not. Focus a line for exact daily values. Open full-size izzi chart (SVG). Chart values and rendering specification (JSON).

Same-calendar check: World Cup versus Crew Girl and Kung Fu Soccer

Compare September 10–23 for Crew Girl and October 3–16 for Kung Fu Soccer. This aligns calendar dates but compares late-circulating World Cup media with newly observed collections. Dan Da Dan was observed in 2025, so it has no overlapping World Cup dates.

Comparator	Country	World Cup D hosting	Comparator D hosting
Crew Girl	USA	50.5%	68.2%
Crew Girl	MEX	0.9%	1.3%
Crew Girl	CAN	41.3%	47.6%
Kung Fu Soccer	USA	53.7%	73.6%
Kung Fu Soccer	MEX	1.1%	0.7%
Kung Fu Soccer	CAN	39.7%	43.9%

H3r8 versus H3r5: the hosting comparison

The finer grid changes retained membership and approximate country assignment. The USA and Canada ordering—World Cup below all three comparator downloader shares—holds at both resolutions. H3r8 remains the primary analysis.

Country	Collection	H3r8 hosting	H3r5 hosting	Difference (percentage points)
USA	World Cup	56.6%	54.9%	+1.67
USA	Crew Girl	68.2%	65.9%	+2.26
USA	Dan Da Dan	65.5%	63.2%	+2.30
USA	Kung Fu Soccer	73.6%	69.8%	+3.81
MEX	World Cup	2.7%	2.7%	-0.02
MEX	Crew Girl	1.3%	1.3%	-0.00
MEX	Dan Da Dan	5.4%	5.4%	+0.04
MEX	Kung Fu Soccer	0.7%	0.7%	-0.01
CAN	World Cup	39.0%	38.9%	+0.08
CAN	Crew Girl	47.6%	47.2%	+0.41
CAN	Dan Da Dan	51.1%	51.0%	+0.13
CAN	Kung Fu Soccer	43.9%	43.0%	+0.85

How much does torrent weighting matter?

The weekly check gives each retained torrent equal weight instead of allowing larger torrents to dominate. It uses **two per-torrent weekly intervals**, so its rates must be compared within this check. The US downloader hosting means become tightly grouped: 76.4% World Cup, 77.2% Crew Girl, 77.3% Dan Da Dan, and 77.0% Kung Fu Soccer. The broad difference in the primary daily comparison therefore does not establish a general sports-versus-fiction network effect. Catalog mix, weighting and filtering matter.

Weekly torrent-weighting sensitivity: downloaders

Descriptive sensitivity ranges, not confidence intervals

Country	Collection	Active torrents	Weekly memberships	Weighted hosting	Equal-torrent hosting	Leave-one-out weighted range	Largest torrent share

Sources, exact values, and comparison rules

Complete reductions · All network counts and shares · Per-torrent weekly sensitivity counts · Native ID to canonical BTIHA crosswalk · New native products and validation manifest · Independent verification · Analysis implementation

The main comparisons use **IPinfo at H3 resolution 8**, with at least three downloaders per cell. Both roles are retained in passing cells. The common, frozen IPinfo databases are applied to every archive: these are snapshot classifications, not verified historical network labels for each observation date. The location database was built May 5, 2026. Dan Da Dan's observation window precedes that snapshot. Database provenance

Daily country comparisons filter the collection aggregate and sum 14 daily IP–canonical-torrent memberships. The same address can recur across torrents, days and roles. Weekly sensitivity results sum two independently deduplicated weekly per-torrent products with a per-torrent cell threshold. Cumulative torrent rankings use their own per-torrent denominator. These grains are not interchangeable.

Hosting, VPN, mobile, satellite, Tor, exit-list, proxy, relay and service are **overlapping flags**. They do not identify viewers, device types, actual traffic, VPN users' origin, or a particular hosting provider. No flag is not proof of a residential connection. The retained products do not expose joint flag intersections, ASN/provider names, or per-record lookup success, so those comparisons cannot be recovered from these marginals.

Crew Girl uses the torrent bytes in `alpha60-data` at the end of its September 23, 2026 sample: commit `6caf08e38f4fed66d76ab9fbc9e4d188a65945f0` (the last preceding commit, September 22). **196 original files resolve to 195 canonical BTIHA.** Every observed cache name joins that snapshot. Later catalog additions are excluded. Archive indices and regenerated native indices are joined through verified metainfo hashes. Frozen-catalog receipt · Crew Girl inventory · Dan Da Dan inventory

The source-file checksums, region definitions, catalog coverage, all nine flags and both H3 resolutions are retained in the downloads. No peer addresses are published by this follow-up.

Two matches, equal observation ages

The focus matches are **USA–Belgium, July 6**, and **Mexico–England, July 5**. England is the match identity; `GBR` is the geographic country code for the United Kingdom, not the name of a World Cup team.

The primary comparison unions IP addresses separately within each canonical torrent over **seven calendar dates beginning with that torrent's first observed daily cache**. Hybrid-hash aliases are unioned before counting. USA–Belgium has 17 eligible torrents; Mexico–England has 14. Differences in available versions, discovery delay, languages and source coverage remain, so raw totals cannot isolate match preference.

First seven observed dates per torrent

Match	Location	D	World D share	U	World U share
USA-BEL-2026-07-06	World	146,684	100.0%	4,234	100.0%
USA-BEL-2026-07-06	United States	8,734	6.0%	501	11.8%
USA-BEL-2026-07-06	Mexico	1,781	1.2%	19	0.4%

Match	Location	D	World D share	U	World U share
USA-BEL-2026-07-06	Canada	4,316	2.9%	156	3.7%
MEX-ENG-2026-07-05	World	118,967	100.0%	6,929	100.0%
MEX-ENG-2026-07-05	United States	6,786	5.7%	537	7.8%
MEX-ENG-2026-07-05	Mexico	1,381	1.2%	94	1.4%
MEX-ENG-2026-07-05	Canada	3,211	2.7%	199	2.9%

Sensitivity: seven dates from the match date

Match	Location	D	World D share	U	World U share
USA-BEL-2026-07-06	World	108,351	100.0%	3,727	100.0%
USA-BEL-2026-07-06	United States	6,242	5.8%	342	9.2%
USA-BEL-2026-07-06	Mexico	1,314	1.2%	18	0.5%
USA-BEL-2026-07-06	Canada	2,994	2.8%	126	3.4%
MEX-ENG-2026-07-05	World	87,541	100.0%	6,279	100.0%
MEX-ENG-2026-07-05	United States	5,014	5.7%	445	7.1%
MEX-ENG-2026-07-05	Mexico	971	1.1%	85	1.4%
MEX-ENG-2026-07-05	Canada	2,261	2.6%	170	2.7%

The match-date windows are July 6–12 for USA–Belgium and July 5–11 for Mexico–England. Only 15 and 12 eligible torrents, respectively, have observations within those windows. The availability-aligned windows include later discoveries and span July 7–28 and July 6–26 across their constituent torrents. These are not two single common calendar weeks. Coverage and exact per-torrent windows are retained in the download.

Top five locations in each host country

Each ranking uses the full cumulative **aggregate** product for the selected role. The last two columns show the same location's membership in each match's availability-aligned window. A zero means no membership retained at that labeled location under the threshold; it is not proof of no local participation. IPinfo locations are approximate, and hosting hubs can dominate.

Interpretation

1. **The two roles tell different stories.** In the availability-aligned world comparison, USA–Belgium has more downloader memberships, while Mexico–England has more uploader memberships. The latter is consistent with different distribution or seeding behavior, not necessarily a larger viewing audience.
2. **Geographic source locations are not home audiences.** Hosting and VPN flags, IPinfo city centers, and the downloader threshold materially qualify city-level uploader rankings. Neither uploaders nor downloaders measure transferred traffic.
3. **Version supply and exposure must be controlled.** Use the equal-age comparison alongside the match-date sensitivity, and compare matched language, resolution and broadcaster versions before attributing a difference to national preference. The current 17-versus-14 torrent supply is not an experiment.

Sources, downloads, and counting rules

City and match comparison CSV · Window coverage and reductions · H3 resolution sensitivity

All content joins use the shared inventory: **493 canonical BTIHA**, with verified hybrid-hash aliases. Alpha60 sampling began **June 29, 2026 — Round of 32**, and ends November 3 in this snapshot. Earlier-event media found later does not establish earlier sampling.

Geographic counts are **IP–torrent memberships**, with an IP counted once per canonical torrent and role within the stated interval. They are not unique people, viewing choices, completed downloads, transferred bytes, or ratings. An address can occur in both roles. Daily sums count the same membership again on another day.

Main geography uses **IPinfo and H3 resolution 8**, the highest resolution used here. The native minimum is **three downloaders per cell**; uploaders are retained only where that downloader threshold passes. Content comparisons filter each torrent separately. Overall country and city comparisons filter after aggregating torrents, so their totals differ. Country and city labels are representative locations within cells, and the finer grid does not improve IPinfo accuracy. Hosting, VPN, proxy and mobile flags overlap; each sensitivity exclusion is applied separately.

See the H3r8 manifest, generation and validation evidence, complete analytical reductions, and methods and coverage. Source hashes make the published snapshot inspectable.

Broadcasters, services, and their distribution

Read the published page online

Filename and video evidence identify 21 candidate branding families. Match TV, FOX and BBC lead by distinct torrent count; unknown and conflicting cases remain explicit.

Broadcast audiences and torrent circulation

Broadcast ratings measure a live event; this torrent catalog mainly records circulation over the months that follow. The two systems offer useful comparisons by fixture, but **torrent IPs cannot be added to television audiences or priced as extra viewers**. On audience delivery, FOX looks like a strong purchase and Telemundo a promising one. The available data do not establish either broadcaster's profit.

This comparison uses the June 29–November 3 Alpha60 snapshot and public releases retrieved November 11 UTC (November 10 in Los Angeles). The Spanish- and French-audio regional plates remain on the language-geography page. External references, source revisions, definitions and downloads are collected in the disclosure at the end of this page.

France · M6	20.2M France–Spain; 12.2M final	July 21 release; audience at July 20	Médiamétrie
Russia · Match TV	50.8M tournament reach; 14.3M final reach	All people 4+; tournament includes recordings and repeats	Mediascope
China · CCTV-5	6.58% tournament-period channel share	CSM 35 cities; share of viewing, not number of people	CSM / CCTV
South Korea · JTBC	3.4% final household rating	Pay-TV household universe; secondary Nielsen Korea report	Nielsen Korea report

Mexico's "60 million" headline lacks enough measurement detail for a quantitative join. No compatible primary fixture series was verified for Türkiye, Argentina or Japan. The UK benchmark predates sampling; Brazil's figure is reach. These are coverage gaps, not evidence of low interest or zero piracy. Source coverage and exclusions.

Torrent country context · cumulative counter in the sixteen-country stage-three roster

Country	Rank within source roster	November 3 country counter
KOR	1	6,360,871
RUS	2	5,388,949
CHN	3	4,768,723
TUR	4	4,183,789
USA	5	3,720,811
FRA	6	2,556,831
BRA	7	2,510,384
ESP	9	1,703,932
CAN	10	1,522,730
MEX	12	1,061,925

South Korea, Russia, China and Türkiye lead this supplied country roster, while the broadcast releases emphasize strong audiences in host and finalist markets. That contrast is descriptive: different release supply, IP locations, platform availability and months of later circulation could contribute. It does not measure national football interest or establish a piracy rate. The country counter above also differs from the new fixture-IP unions below; neither counts people. The UK and Argentina are absent from the roster, not zero. Roster definition and data.

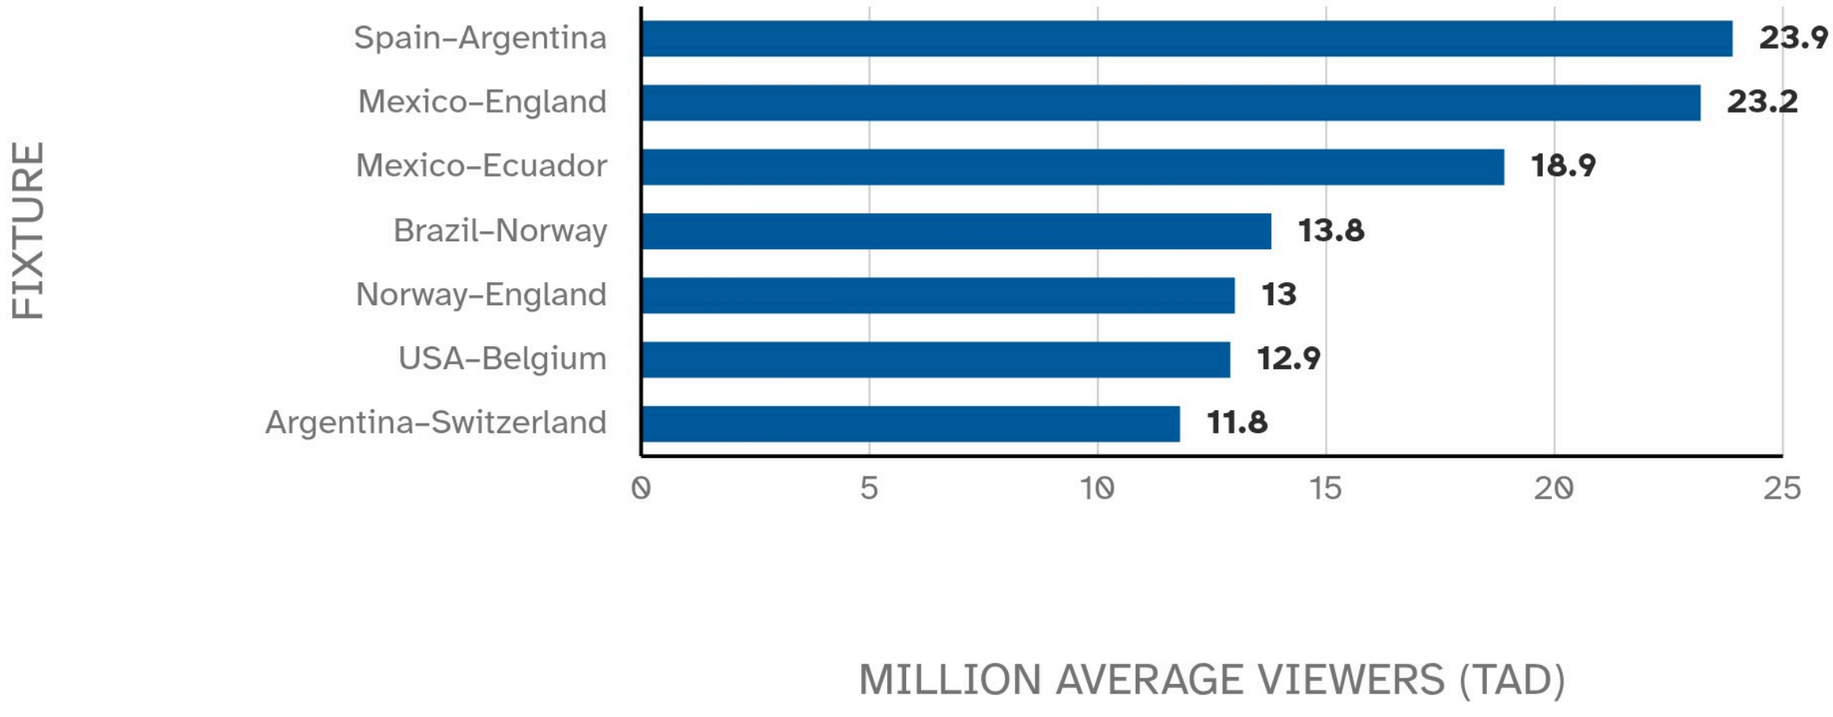

The same fixtures, at the same observed torrent age

The fixture audit selects **270 canonical full-match titles across 19 fixtures**, while retaining every one of the 493 catalog records in the exclusion ledger. The selected 28-day windows contain **0 missing canonical cache dates**. Observation begins 0–24 calendar days after the recorded fixture date; that is discovery lag, not a measured upload or kickoff delay.

Daily downloader addresses are unioned across cache dates and canonical aliases, then across versions of each fixture. Each version starts at its own first cache date, so the fixture union can span different calendar intervals. These country counts use the frozen IPinfo database directly and **do not use the H3 cell-retention threshold** used by the older maps. The table compares domestic torrent IPs across all observed audio languages with the specified broadcast series. It does not establish that those peers watched that broadcaster or language.

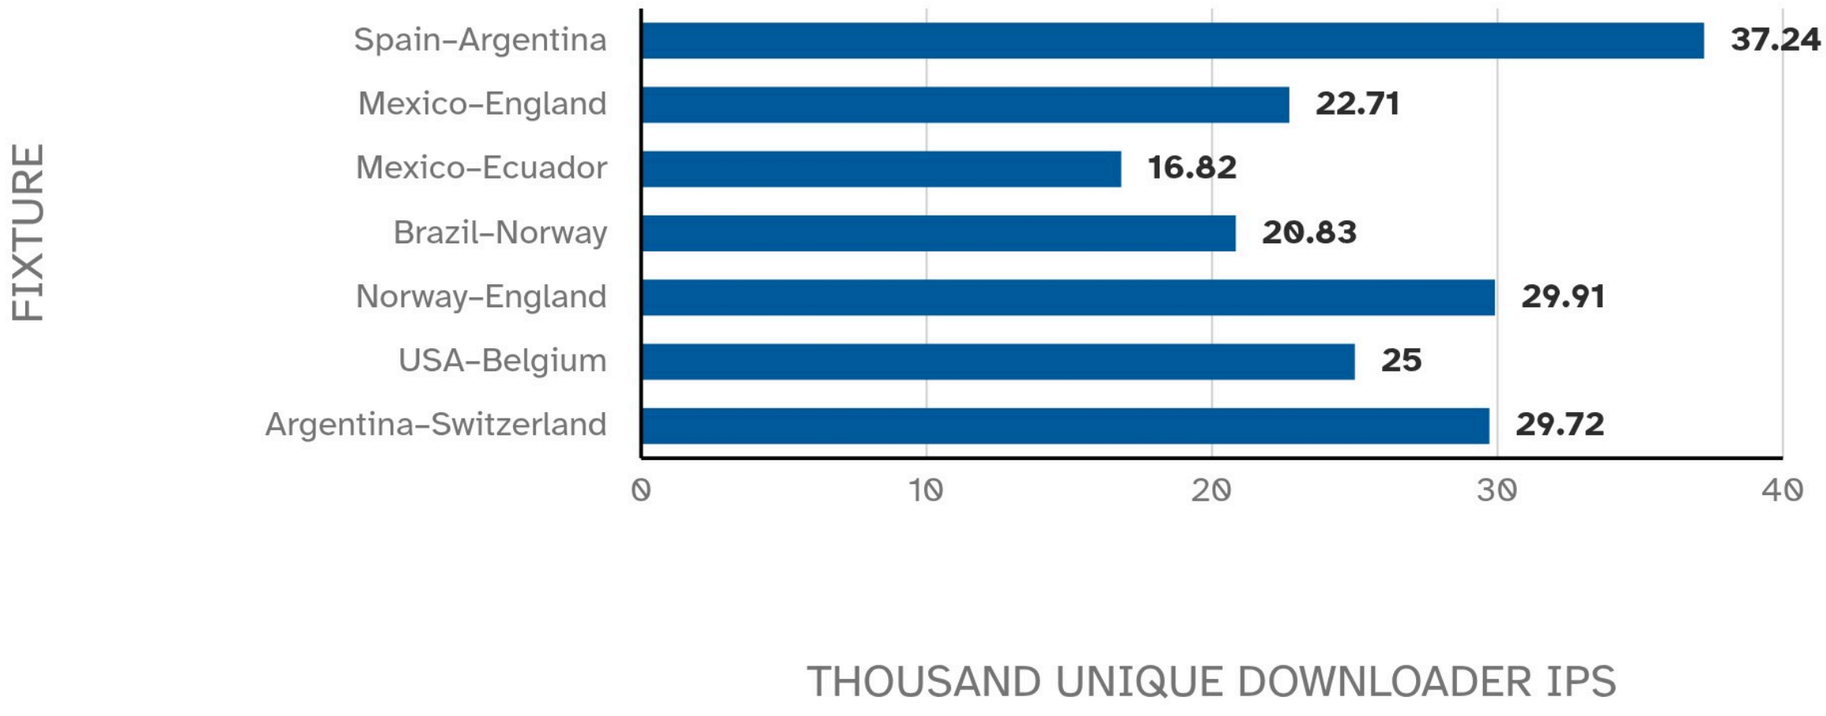

Fixture joins use the full catalog titles against the cited fixture calendar; aliases and audio metadata retain their existing inventory evidence. The label "full-match title" excludes explicit highlights, historical matches, packs and partial-match titles. It is not a verification of every minute of the downloaded video. Exact broadcast-window timestamps are unavailable in these releases and remain missing in the ledger.

US Spanish-language match audiences

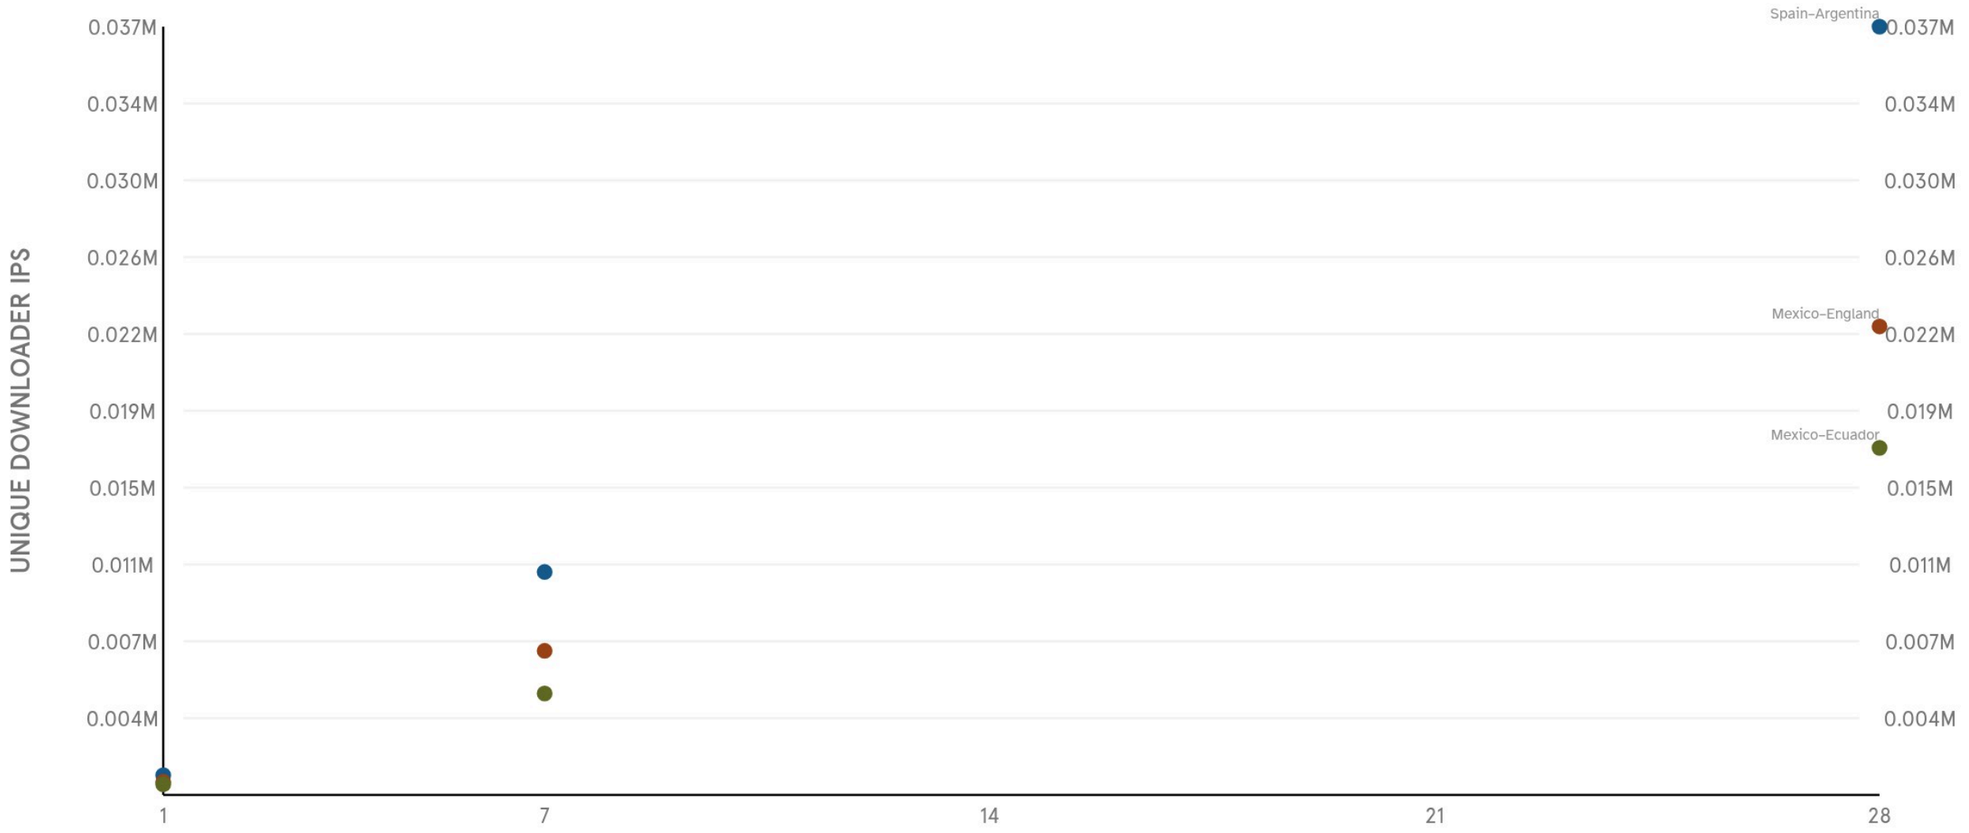

US Spanish-language broadcast panel · reported match-window TAD; same fixture order as the torrent panel. Values and downloads.

US torrent IPs for the same fixtures

US torrent panel · first 28 days from each torrent's first observed cache; all audio languages; unique IP union across versions. Values and downloads.

US unique downloader IPs at one, seven and 28 days · integer day axis; markers show the three measured windows, with intervening days unplotted. Values and downloads.

Descriptive rank agreement at 28 days · Spearman rho

Published fixture selection	Fixtures	All IPs	Excluding hosting	Excluding VPN	Omit one fixture · range
US-Spanish	7	-0.036	-0.107	-0.036	-0.657 to 0.086
Canada	7	0.396	0.396	0.396	0.029 to 0.657
France	2	Not estimated	Not estimated	Not estimated	Not estimated
Russia	8	0.405	0.405	0.405	0.107 to 0.679

A positive rho means similar ordering within that selected country series; a negative value means opposite ordering. These selectively reported fixtures are not a random sample. No significance test, global country correlation or population estimate is implied. France has only two compatible rows, so no coefficient is estimated. The downloadable ledger also contains days 1 and 7, membership sums and all separate network exclusions. FOX’s USA–Belgium figure includes pre-match coverage, so its small mixed-window series is not included in this rank table.

The US comparison shows **almost no overall rank agreement at 28 days (rho -0.036)**. Canada and Russia show modest positive agreement within their published selections. The leave-one-fixture-out ranges show how much each small comparison depends on its included matches.

For the seven available US Spanish-broadcast fixtures, **Spain–Argentina leads television TAD; Spain–Argentina leads the 28-day domestic torrent IP union**. This comparison is sensitive to the release catalog and observed age. It does not show how many television viewers switched to piracy. The identified Spanish releases are mostly European-source broadcasts, and no Telemundo-branded release was identified in the catalog review below.

Catalog, language and network checks

The final cumulative torrent count increases by 49,575,177 after July 19, **87.6% of its November 3 endpoint**. Keeping only the 416 torrents already present at the July 19 weekly endpoint still adds 42,291,217; the 77 later catalog entries account for 7,283,960 at the endpoint. Catalog expansion therefore explains only part of the accumulation. The later period is much longer, and these totals still do not identify delayed viewers.

Full-window language sensitivity · retained H3r8 IP–torrent memberships

Verified audio selection	Country	Torrents	All memberships	Excluding hosting	Excluding VPN
spa · all	USA	7	56,672	34,747	42,974
spa · all	CAN	7	28,283	21,886	21,974
spa · all	MEX	7	21,692	21,517	21,490
spa · 2026-only	USA	6	47,270	28,709	35,805
spa · 2026-only	CAN	6	23,754	18,345	18,416
spa · 2026-only	MEX	6	17,995	17,846	17,822
fra · all	USA	2	18,553	11,446	13,556
fra · all	CAN	2	9,467	7,254	7,207
fra · all	MEX	2	6,536	6,463	6,454

Dropping each Spanish torrent in turn leaves these full-window country-count ranges: **USA 45,229–51,435; CAN 22,588–25,520; MEX 16,391–19,941**. They are sensitivity ranges, not uncertainty intervals. The 2002 Spain–South Korea replay is excluded in the 2026-only row. The French sample contains only South Africa–Canada and France–Sweden; it cannot stand in for French-language coverage of the whole competition. Unknown audio is not assigned from a filename.

The Spanish city concentrations are descriptive IP locations, including hosting networks. Existing state and city checks do not supply a Nielsen DMA crosswalk; no city-to-DMA audience join is made here. Network filters use frozen flags that can overlap and need not identify a viewer's residence.

Languages within the same fixtures · first 28 days

Observed-age IP–torrent memberships · unthresholded country lookup; audio groups may overlap

Fixture	Verified audio	Versions	USA memberships	Canada memberships	Mexico memberships
Spain–Argentina	eng	10	12,989	6,762	3,449
Spain–Argentina	spa	2	8,523	4,745	3,245
Canada–South Africa	eng	3	5,648	2,403	992
Canada–South Africa	spa	1	2,719	1,332	671
Canada–South Africa	fra	1	4,179	2,041	940

Fixture	Verified audio	Versions	USA memberships	Canada memberships	Mexico memberships
Spain–Belgium	eng	7	17,156	8,658	4,539
Spain–Belgium	spa	1	2,496	1,361	648
Spain–Austria	eng	4	7,084	2,991	1,539
Spain–Austria	spa	1	1,760	832	346
France–Sweden	eng	6	16,257	7,782	4,660
France–Sweden	spa	1	2,680	1,378	862
France–Sweden	fra	1	2,118	1,039	480

The main US television comparison uses all audio languages. Only the final among its seven fixtures has a verified Spanish-audio release in this catalog. Missing Spanish supply cannot be interpreted as no Spanish-language piracy. Multi-audio files count in each verified group; these rows cannot be added as independent audiences.

The 51 FOX-attributed torrents retain 6,346,065 worldwide downloader memberships, with 338,577 in the USA (5.3%). Removing hosting flags leaves 208,971 US memberships; removing VPN flags separately leaves 258,713. The broad international footprint is consistent with source redistribution. It does not establish extra monetizable FOX reach or the amount of domestic revenue displaced.

Were the 2026 rights good purchases?

My assessment: strong audience value for FOX; promising audience value for Telemundo, with more dependence on streaming monetization. That is an audience-delivery judgment. Public ratings and this piracy sample cannot establish return on investment.

Reported current fees are about **$485M for FOX and $600M for Telemundo**. Reports conflict on whether those amounts describe 2026 alone or a package including the 2023 Women's World Cup. Earlier reporting described FOX's $300M base plus a $180M host bonus, and Telemundo's minimum $350M plus a $115M host bonus. Those are alternative reported assumptions, not an audited price interval. These U.S. language packages are not all North American rights. Contract reports and scope conflict.

Illustrative fee per summed match-average audience unit · USD

Fee assumption	Reported fee	104 × tournament average	100% allocated to 2026	75% allocated to 2026
FOX · current report	$485M	804.648M	$0.603	$0.452
FOX · 2017 conditional report	$480M	804.648M	$0.597	$0.447
Telemundo · current report	$600M	655.200M	$0.916	$0.687
Telemundo · 2017 reported minimum	$465M	655.200M	$0.710	$0.532

The denominator is an equal-match index, not deduplicated reach, viewer-hours, ad impressions or paying customers. Match durations differ. The 75% allocation is an arbitrary package-scope sensitivity. Neither column measures profit; production costs, actual net ad sales, subscriptions and retention remain missing. Piracy adds **$0** to the base valuation because conversion or displacement has not been measured.

A 2027 rights estimate with an explicit commercial model

For the 2027 Women's World Cup, my working U.S.–Canada estimate is $200M, with an illustrative $150M–$250M negotiating band. The center is the reported same-event Netflix transaction; the band is an analyst ±25% judgment, not a fitted statistical interval. This is the 32-team, 64-match tournament in Brazil, not a repeat of the 2026 men's event. Netflix's announced territory includes the USA and Canada; Mexico requires a separate package. The 2027 price report is unconfirmed by the contracting parties. A separate earlier $300M report covers 2027 and 2031 U.S. rights; differences in territory and term prevent inferring a 2031 price by subtraction. Rights scope and price evidence.

The commercial scenarios below ask what a buyer could support from assumed net advertising, incremental acquisition and retention, sponsorship and distribution, after production, technology, marketing, discounting and a profit/risk reserve. **Every commercial input is an assumption**, not a Netflix forecast or an observed conversion from pirate downloads.

Historical FOX/FS1 tournament averages were 1.66M in 2019 and 0.669M in 2023, with major differences in scheduling and U.S. team progress. The assumed 3.0M U.S.–Canada base therefore requires substantial improvement as well as a broader territory; the 2026 men's results do not establish that growth. Historical benchmark definitions.

U.S.–Canada 2027 · conditional capacity, not a confidence interval

Scenario	Average audience	Net ads	New + retained contribution	PV event costs	Supported nominal rights fee
Adverse	1.5M	$18.1M	$29.4M	$33.4M	$7.7M
Base	3.0M	$133.7M	$100.8M	$38.1M	$162.6M
Upside	4.5M	$361.2M	$252.0M	$52.4M	$481.1M

The base case supports **$162.6M**, below the reported $200M price. At the same assumptions, supporting $200M requires another **5.85M incremental paid account-months**, or equivalent net commercial contribution. The reported purchase can be rational for a buyer with stronger acquisition, retention or advertising economics than this base case; the piracy data do not establish those economics.

Commercial assumptions · adverse / base / upside

Reproducible commercial assumptions

Input	Assumptions
Ad audience / inventory	1.5M / 3.0M / 4.5M average; ad eligibility 45% / 65% / 75%; 20 / 28 / 32 spots per match

Input	Assumptions
Ad sales	70% / 85% / 95% sell-through; net CPM $30 / $45 / $55 after sales and ad-serving fees
Incremental acquisition	0.75M / 1.5M / 2.5M new accounts, contributing for 4 / 6 / 8 months
Incremental retention	0.6M / 1.2M / 2.0M existing accounts retained for 2 / 3 / 4 extra months; disjoint from new accounts
Account contribution	$7 / $8 / $9 per incremental month, excluding ad revenue and event costs
Sponsorship / distribution	$8M / $15M / $25M sponsorship outside spot inventory; $0 incremental distribution income
Event costs	$35M / $40M / $55M: 50% production, 20% technology, 30% marketing
Risk and time	20% / 15% / 12% of PV contribution reserved; 10% discount rate; 50% rights paid now and 50% after 0.7 years
Cash timing	Ads and sponsorship at 0.75 years; subscription contribution at 1.0 year; event costs at 0.5 years after November 10, 2026
Piracy and strategic value	$0 in every base scenario; no assumed pirate-to-paid conversion or franchise terminal value

One-change sensitivities · team progress, availability, yield, retention and costs

Change from base assumptions	Supported nominal fee
Early team exits / weaker schedule	$95.9M
Stronger team progress / viewing windows	$229.4M
Ad yield 20% below base	$140.8M
Ad yield 20% above base	$184.5M
Broad ad availability	$196.3M
Limited ad availability	$129.0M
Shorter retention	$147.3M
Higher production and delivery costs	$142.9M
All rights paid now	$157.4M

Mexico remains unpriced as fair market value. No comparable transaction or sufficiently grounded buyer revenue inputs were verified. The prior $10M–$30M planning guess and $160M–$280M combined North American range are withdrawn as market estimates. The workbook keeps a separate Mexico revenue illustration with fully exposed assumptions; it is not added to the U.S.–Canada estimate.

For scale only, 25,000 hypothetical additional paying accounts contributing $8 per month for six months would provide $1.2M before discounting and the reserve. Losing the same contribution has the opposite effect. No such conversion or displacement rate was observed here; the workbook includes both directions and the zero base.

What can be attributed

360 of 493 torrents (73.0%) have one unambiguous candidate branding family. The remaining 133 comprise 130 unknown cases and three unresolved conflicts. The ranking combines 150 filename claims corroborated by a sampled frame, 118 visual-only attributions, and 92 filename-only claims. Each canonical hash is counted once.

The term “vendor” here covers observed **broadcaster or service branding**. It does not identify the peer’s ISP, prove the capture platform, establish rights ownership, or verify a whole broadcast. In particular, a BBC iPlayer promotion can establish branding in a fragment without proving that iPlayer supplied the download.

Rank	Branding family	Torrents	Share of all 493	Filename + frame	Frame only	Filename only
1	Match TV	129	26.2%	85	31	13
2	FOX	51	10.3%	8	0	43
3	BBC	46	9.3%	15	6	25
4	TSN	21	4.3%	16	3	2
5	BNT	20	4.1%	0	20	0
6	ITV	20	4.1%	3	16	1
7	Sport TV (Cyrillic label)	16	3.2%	16	0	0
8	MagentaTV / FUSSBALL.TV 1	9	1.8%	0	9	0
9	MEGOGO	9	1.8%	0	9	0

20	Now TV	1	0.2%	0	1	0
21	ZDF	1	0.2%	1	0	0

Download the attribution table. `FUSSBALL.TV 1` is shown with MagentaTV because Deutsche Telekom identifies it as a MagentaTV World Cup channel; a second reviewed frame also displays the MagentaTV wordmark. Deutsche Telekom announcement

Video evidence and unresolved cases

The cache contains 430 verified torrent fragments; 427 produce at least one reviewable frame. Extraction attempted 0.5, 10.0 and 30.0 seconds and yielded 1,011 frames. The latest successful frame from every decodable fragment was visually reviewed, producing 271 readable brand observations. A further **115 earlier frames** were reviewed for visual-only or conflicting cases: 98 repeat the same brand mark, 17 are inconclusive, and none introduce a new conflict. These checks establish evidence within short fragments, not persistence across entire broadcasts.

Three torrents retain conflicting claims: one BBC filename with Match TV imagery, one filename mentioning Match TV and Rai with Match TV imagery, and one beIN filename with FUSSBALL.TV 1 imagery. They remain outside assigned vendor cohorts. beIN is therefore an unresolved filename candidate rather than an assigned vendor count.

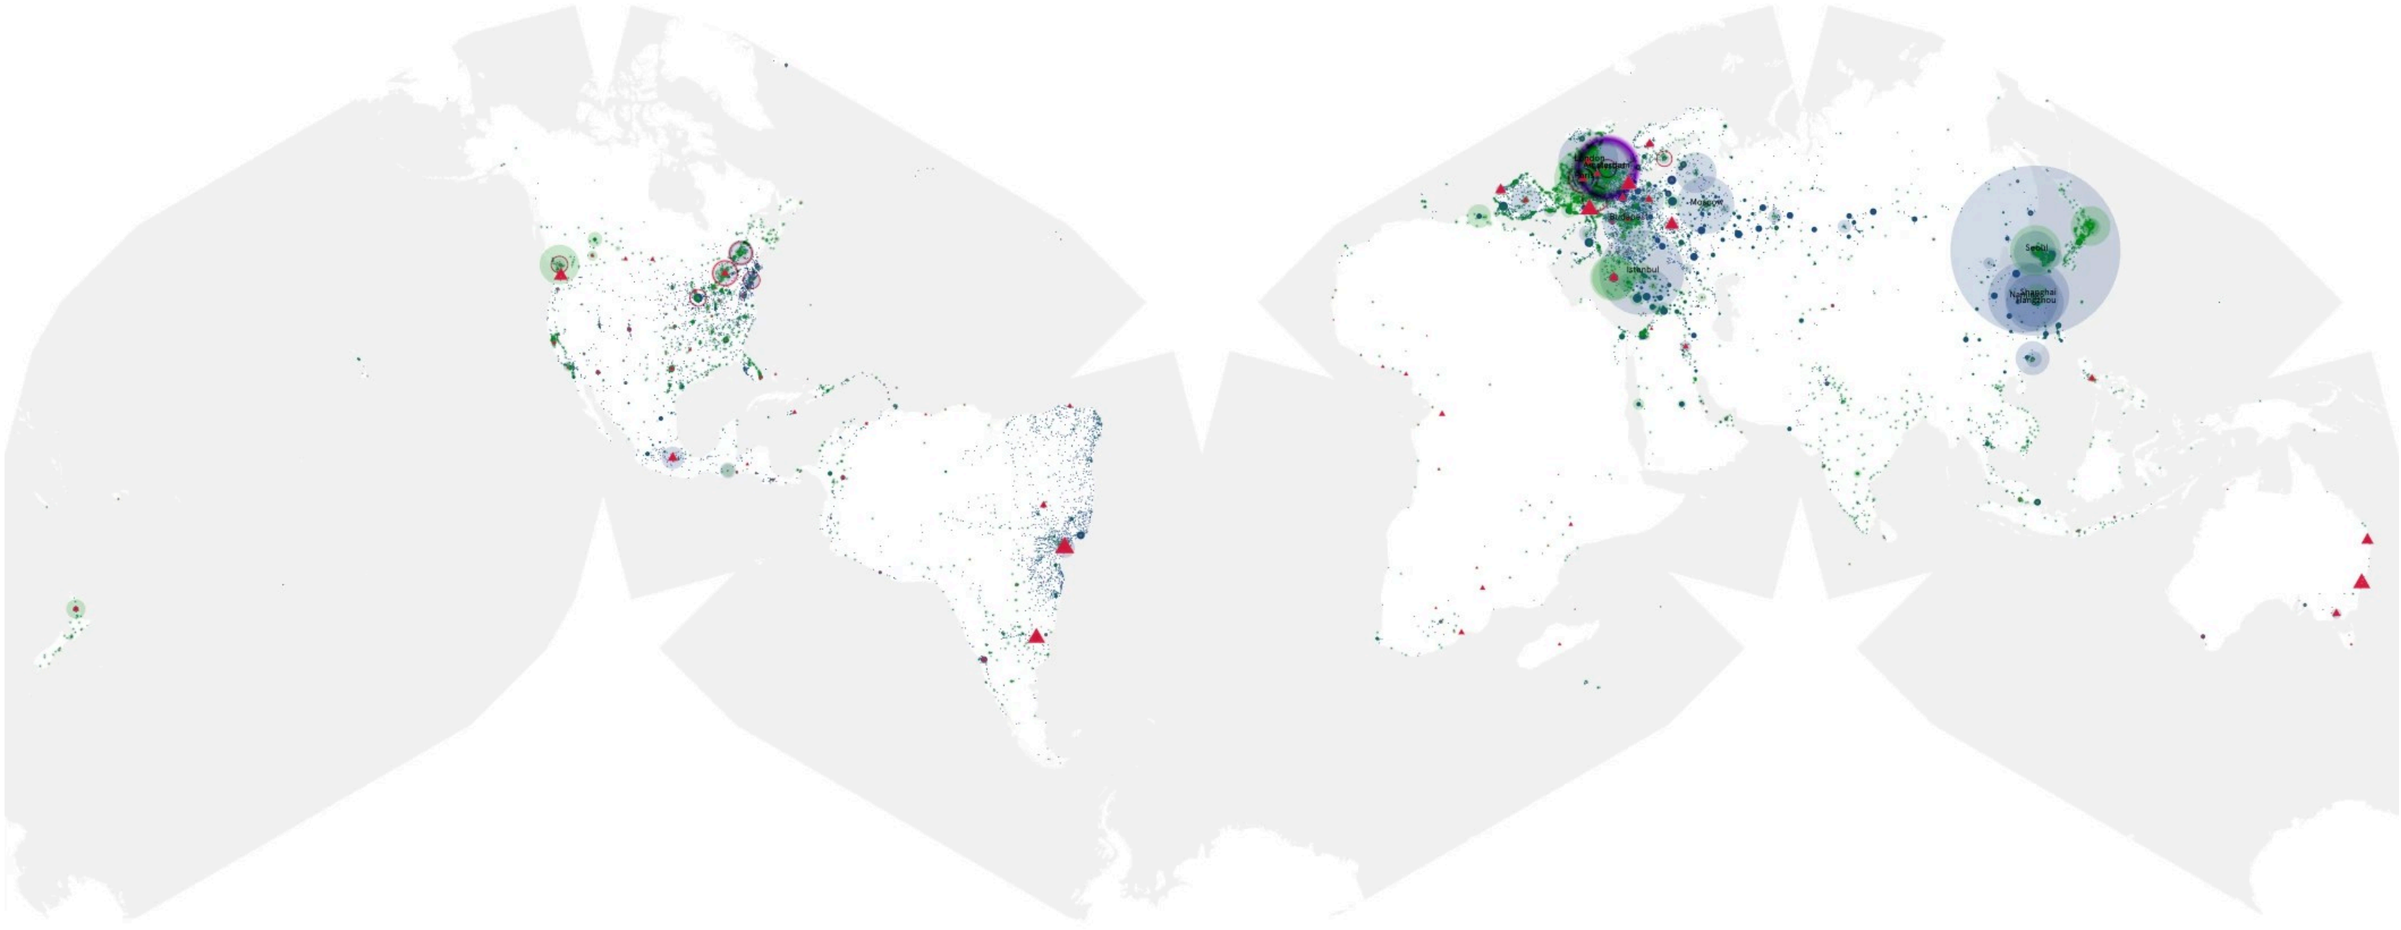

The 51 FOX assignments can be distinguished from unknown material using their recorded evidence. **No explicit Telemundo, Univision, TUDN or ViX candidate was found in the filename and sampled-frame review.** This does not establish that their broadcasts are absent from the underlying population, or even from unclassified files in this inventory.

Native Cahill–Keyes maps

Each map uses **alpha60-carto-geo's current swarm rendering**, the Cahill–Keyes projection, and H3r8 cells from the assigned canonical torrent cohort. Retained counts are summed without inflating them to unfiltered swarm totals. Unknown and conflicting cases have a separate map.

Legend: blue marks show downloader memberships; green shows mobile flags; purple rings show hosting flags; pink rings show service flags; red triangles show satellite flags. Categories overlap. **Each map scales its marks independently**, including its network layers: compare geographic patterns within a map, and use numeric counts to compare vendors. Small marks and labels are easier to inspect in the downloadable SVG.

FOX, Telemundo, and English-speaking viewers

The July 9–10 Associated Press report describes some English-speaking people choosing Telemundo's Spanish-language coverage. That is contextual reporting about viewing behavior. Torrent metadata records available content and observed distribution, so it cannot independently verify the language spoken by those viewers or their reasons for choosing a channel. San Antonio Express-News / Associated Press

This inventory supports a FOX-branded cohort, but **does not supply a defensible Telemundo cohort for a FOX–Telemundo swarm comparison**. Nor can the seven Spanish-audio torrents stand in for Telemundo: audio language and broadcaster are different attributes. A better study needs explicit broadcaster sampling, repeated frame evidence, matched games and observation ages, and separate consent-based evidence about actual viewing choices.

Sources, downloads, and counting rules

Broadcast comparison downloads and counting rules

The stage-four source ledger records retrieval date, source version, market, language, platform, measurement provider, population, metric, window, overlap and exclusions. Published broadcaster releases are evidence of what was reported, not independent access to provider microdata. All quoted audience figures are kept separate from estimates and analyst assumptions.

- Sources, measurements, fees and exclusions (JSON)
- Audience measurement ledger (CSV)
- All 493 catalog dispositions and fixture joins (JSON)
- One-, seven- and 28-day counts, names and coverage (JSON)
- Selected full torrent names and windows (CSV)
- Rank comparisons and all network/age sensitivities (JSON)
- Retained language and FOX sensitivity (JSON)
- Fixed catalog versus later additions (JSON)
- Stage-three country roster and definition (JSON)
- 2027 commercial assumptions, formulas and results (JSON)
- 2026 fee and allocation calculations (JSON)
- Read-only Gold cache input hashes (compressed JSON)

- world-cup-broadcast-us-audiences: native SVG · values and rendering specification.
- world-cup-broadcast-us-torrents: native SVG · values and rendering specification.
- world-cup-broadcast-observed-age: native SVG · values and rendering specification.

The new age-window series unions downloader IPs from daily caches across canonical aliases and fixture versions. It uses frozen IPinfo country and privacy databases directly, without the map's H3 threshold. Day one includes the first observed cache date; day 28 ends 27 calendar days later. Missing dates are recorded, never

interpolated. A fixture union joins the independently aligned windows of its versions, not a single simultaneous audience. Unknown audio remains unknown; multi-audio releases can appear in more than one audio group, so language rows must not be summed.

The retained-geography table preserves the existing per-torrent H3r8 threshold of three downloaders. Hosting and VPN exclusions overlap and are performed separately. IP locations and network flags come from the archived database vintage; they do not establish residence. No IP addresses are included in these public downloads. The inventory hashes, cache hashes and database build dates are retained for reproduction.

Rights fees and revisions

Sources 14, 19 and 31–33 contain the fee reports. The $485M/$600M figures have conflicting standalone-versus-bundle descriptions. The 2017 fee-plus-host-bonus reports are historical conditional terms, not confirmations of the final bill. The analysis shows both full allocation and an assumed 75% allocation, without selecting an undisclosed contract allocation. No Canadian or Mexican rights are priced from the U.S. English/Spanish fees.

The announced 2027 Netflix geography is supported by sources 17–18; source 19 reports $200M for 2027 US+Canada. Source 31 separately reports $300M for 2027+2031 US rights. They are not interchangeable. Actual contract schedules, Mexico comparables, future net CPM, account acquisition, retention and costs remain unknown. Source 29 confirms the production partner, not its fee. The valuation workbook labels all commercial assumptions and keeps Mexico separate.

Telemundo Mexico–England is 23.2M in source 21, replacing the 23.1M earlier report in source 30. The preliminary 22.6M final in source 34 is superseded by 23.9M. M6's 20.3M semifinal in source 24 is consolidated J+28 (or J+7 if unavailable), whereas source 10 reports 20.2M at July 20; the paired M6 comparison uses the same July 21 release vintage. FOX USA–Belgium includes pre-match coverage (source 26) and is excluded from matched-window ranking. The expanded Nielsen OOH footprint (source 07) limits historical comparisons.

Coverage gaps and excluded comparisons

Source gaps · absence is not zero

Market	Treatment	Reason
MEX	excluded	60M Mexico–England headline lacks sufficient metric/provider/universe definition; no verified Mexico 2027 rights fee comparable.
KOR	context-only	Household ratings for broadcaster-specific universes; no verified person-AMA series.
CHN	context-only	CSM 35-city share differs from national person AMA; total contacts cannot establish unique audience.
TUR	unavailable	2026 rights/distribution source found, no compatible reported post-event fixture audience verified. 2022 figures excluded.
GBR	outside-cache-window	ITV June 17 England–Croatia 14.2M match average predates June 29 sampling.
ARG	unavailable	No sufficiently defined primary fixture series verified in this bounded review.
JPN	unavailable	No sufficiently defined primary fixture series verified in this bounded review.

Market	Treatment	Reason
BRA	reach-only	142.7M Globo reach differs from average audience; deduplication/provider details insufficient for cross-market ranking.
ESP	context-only	RTVE final 14.5M and 33-match average 4.870M retained; competing all-channel and extra-time windows cannot be silently combined.

Attribution CSV · Primary visual review · Earlier-frame checks · Map provenance

All content joins use the shared inventory: **493 canonical BTIHA**, with verified hybrid-hash aliases. Alpha60 sampling began **June 29, 2026 — Round of 32**, and ends November 3 in this snapshot. Earlier-event media found later does not establish earlier sampling.

Geographic counts are **IP–torrent memberships**, with an IP counted once per canonical torrent and role within the stated interval. They are not unique people, viewing choices, completed downloads, transferred bytes, or ratings. An address can occur in both roles. Daily sums count the same membership again on another day.

Main geography uses **IPinfo and H3 resolution 8**, the highest resolution used here. The native minimum is **three downloaders per cell**; uploaders are retained only where that downloader threshold passes. Content comparisons filter each torrent separately. Overall country and city comparisons filter after aggregating torrents, so their totals differ. Country and city labels are representative locations within cells, and the finer grid does not improve IPinfo accuracy. Hosting, VPN, proxy and mobile flags overlap; each sensitivity exclusion is applied separately.

See the H3r8 manifest, generation and validation evidence, complete analytical reductions, and methods and coverage. Source hashes make the published snapshot inspectable.

Asia-28, China, and the long distribution tail

Read the published page online

South Korea and China lead observed Asia-28 distribution. Matched-age comparisons show different geographic patterns across media objects, while team-tagged files do not identify fandom.

Largest observed distributions

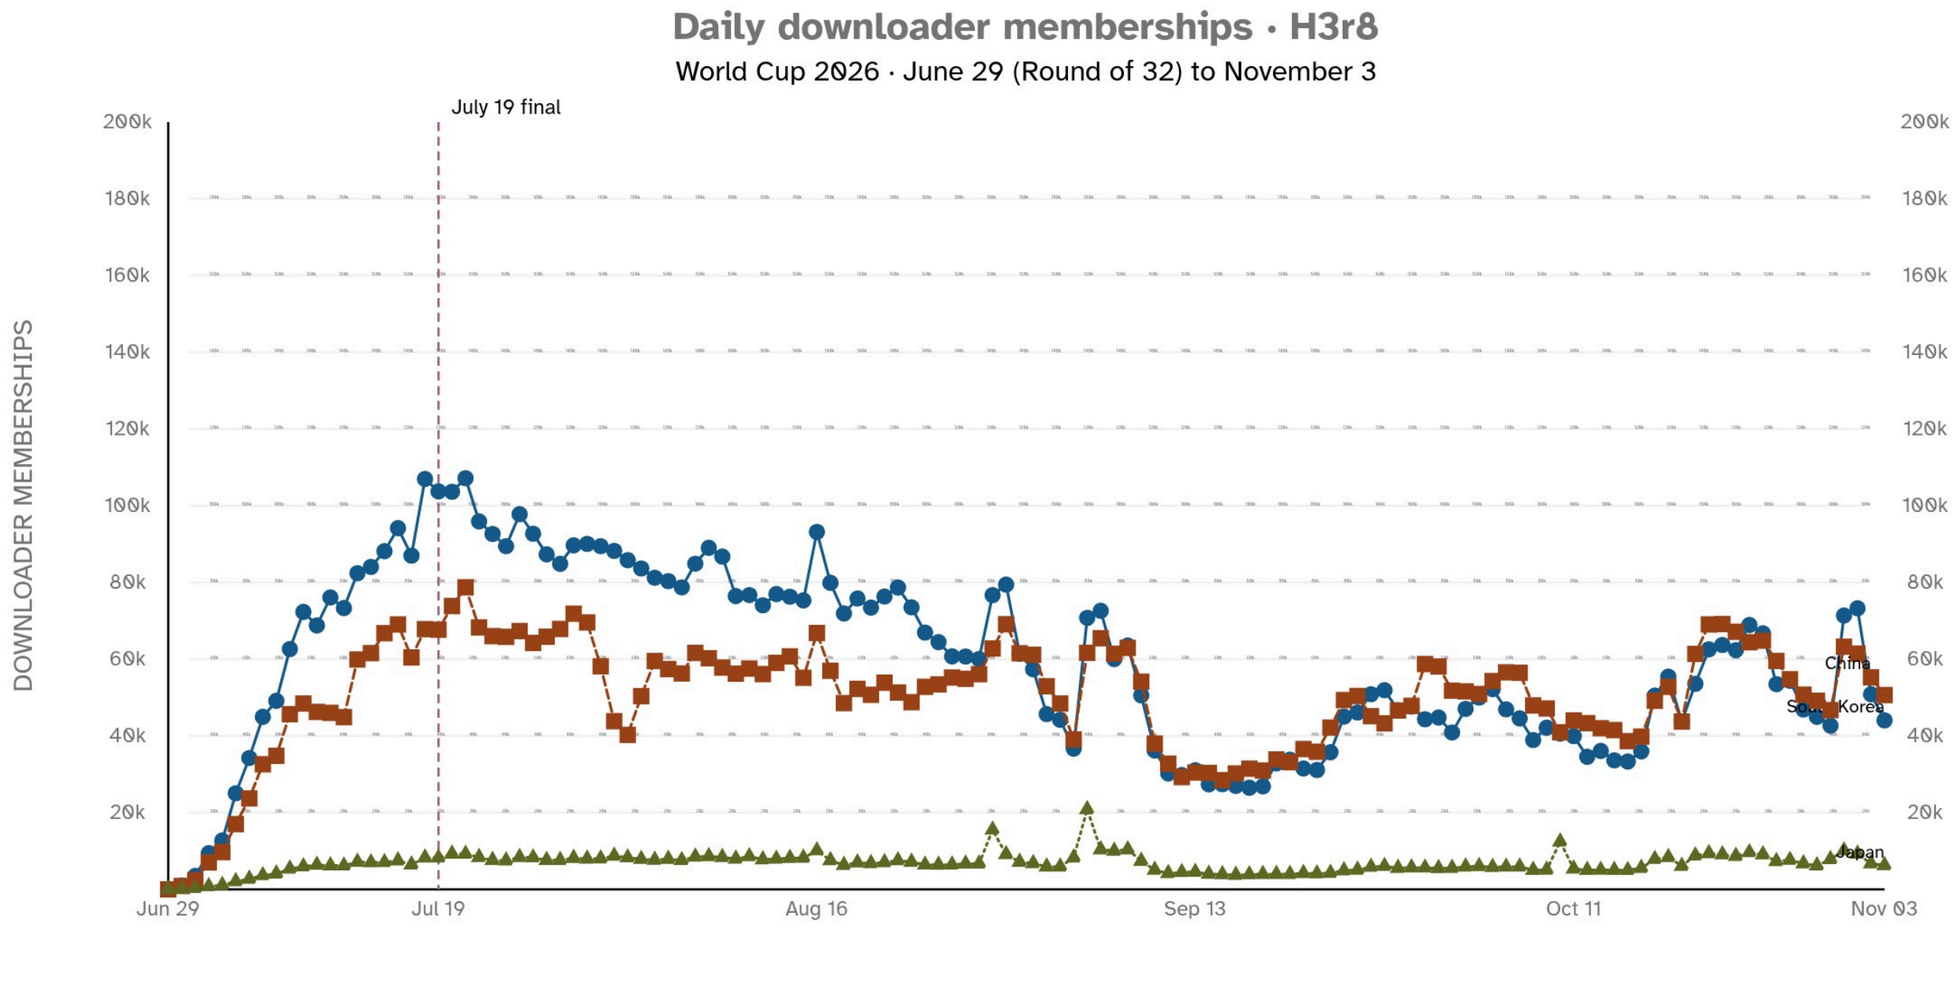

South Korea and China lead Asia-28 in retained downloader memberships, followed by Japan. They remain the top two when hosting, VPN, proxy or mobile flags are excluded separately. This is a ranking of observed distribution, not a ranking of national fandom or per-capita popularity.

Rank	Location	ISO code	Downloader memberships	Asia-28 D share	Uploader memberships
1	South Korea	KOR	6,360,863	46.5%	2,908
2	China	CHN	4,768,612	34.8%	49,626
3	Japan	JPN	779,835	5.7%	3,480
4	Taiwan	TWN	328,306	2.4%	1,783
5	Hong Kong	HKG	290,091	2.1%	3,233
6	India	IND	242,333	1.8%	11,222
7	Pakistan	PAK	231,838	1.7%	721
8	Singapore	SGP	144,829	1.1%	3,144
9	Thailand	THA	132,421	1.0%	3,567
10	Malaysia	MYS	106,388	0.8%	1,204
11	Philippines	PHL	91,201	0.7%	1,194
12	Vietnam	VNM	64,889	0.5%	1,249
13	Indonesia	IDN	60,522	0.4%	1,891
14	Bangladesh	BGD	23,648	0.2%	2,428
15	Mongolia	MNG	22,862	0.2%	101
16	Macao	MAC	13,594	0.1%	306
17	Iran	IRN	8,548	0.1%	412
18	Cambodia	KHM	5,525	0.0%	363
19	Nepal	NPL	3,865	0.0%	469

Rank	Location	ISO code	Downloader memberships	Asia-28 D share	Uploader memberships
20	Sri Lanka	LKA	3,183	0.0%	182
21	Maldives	MDV	2,809	0.0%	56
22	Myanmar	MMR	2,359	0.0%	72
23	Laos	LAO	1,426	0.0%	52
24	Brunei	BRN	671	0.0%	17
25	Afghanistan	AFG	579	0.0%	13
26	Bhutan	BTN	481	0.0%	2
27	Timor-Leste	TLS	37	0.0%	1
28	North Korea	PRK	0	0.0%	0

Asia-28 uses the repository's fixed 28-code definition. Macao (`MAC`) and Taiwan (`TWN`) each appear once. Its geographic membership is an analytical convention, not a statement about political status.

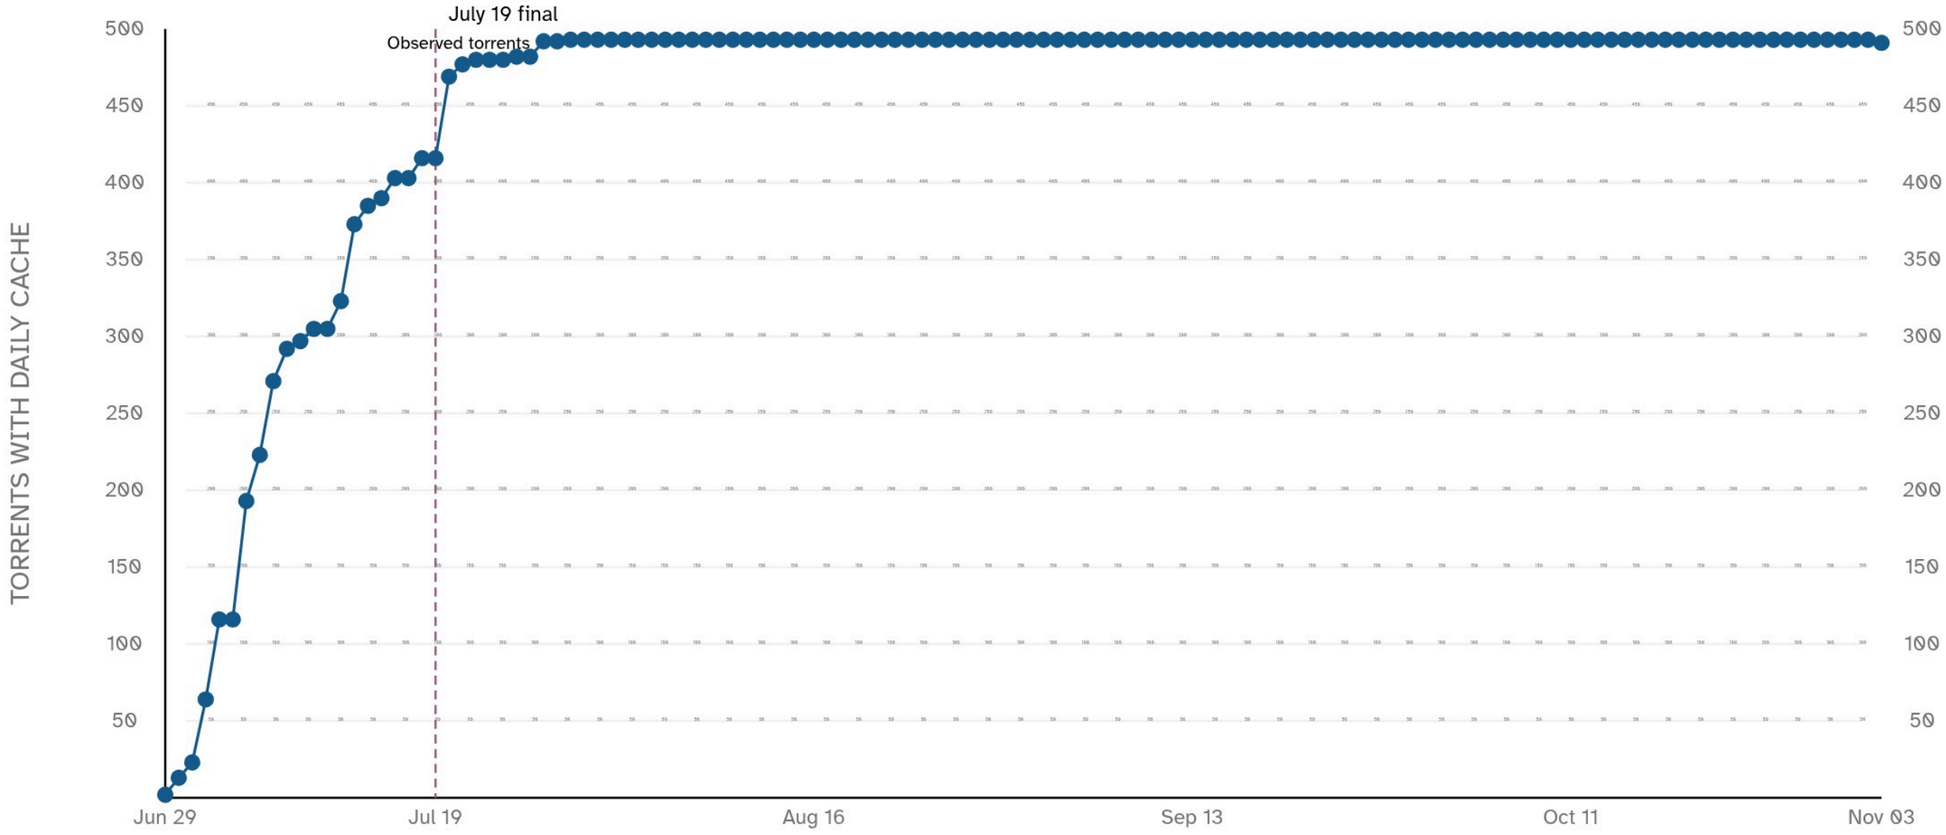

Timing, duration, and coverage

The dashed line marks the July 19 final. Catalog coverage grows from two torrents on June 29 to 416 on July 19. Memberships are counted anew each day; the lower panel shows availability coverage, not viewer counts. Focus or tap a line for emphasis and a point for exact values. On narrow screens, scroll within the chart. Open full-size izzi chart (SVG). Chart values and rendering specification (JSON).

Daily catalog coverage

World Cup 2026 · June 29 (Round of 32) to November 3

Daily intervals · missing intervals are not connected · final marked July 19

The dashed line marks the July 19 final. Catalog coverage grows from two torrents on June 29 to 416 on July 19. Memberships are counted anew each day; the lower panel shows availability coverage, not viewer counts. Focus or tap a line for emphasis and a point for exact values. On narrow screens, scroll within the chart. Open full-size izzi chart (SVG). Chart values and rendering specification (JSON).

Location	Peak observed date	Peak daily D	Daily mass after final	Days with retained D
South Korea	2026-07-21	107,171	84.5%	127
China	2026-07-21	78,727	87.4%	127
Japan	2026-09-05	20,847	88.8%	127
Taiwan	2026-09-05	4,832	88.2%	127

Across Asia-28, **86.1% of summed daily downloader memberships occur after the final**. That period lasts 107 of the 128 sampled dates and includes a much larger torrent catalog. It is evidence of a long observed distribution tail, not proof that demand rose after the event. Country peak dates may reflect discovery, network infrastructure, repeated peers or changing version supply.

Urban and rural interpretation

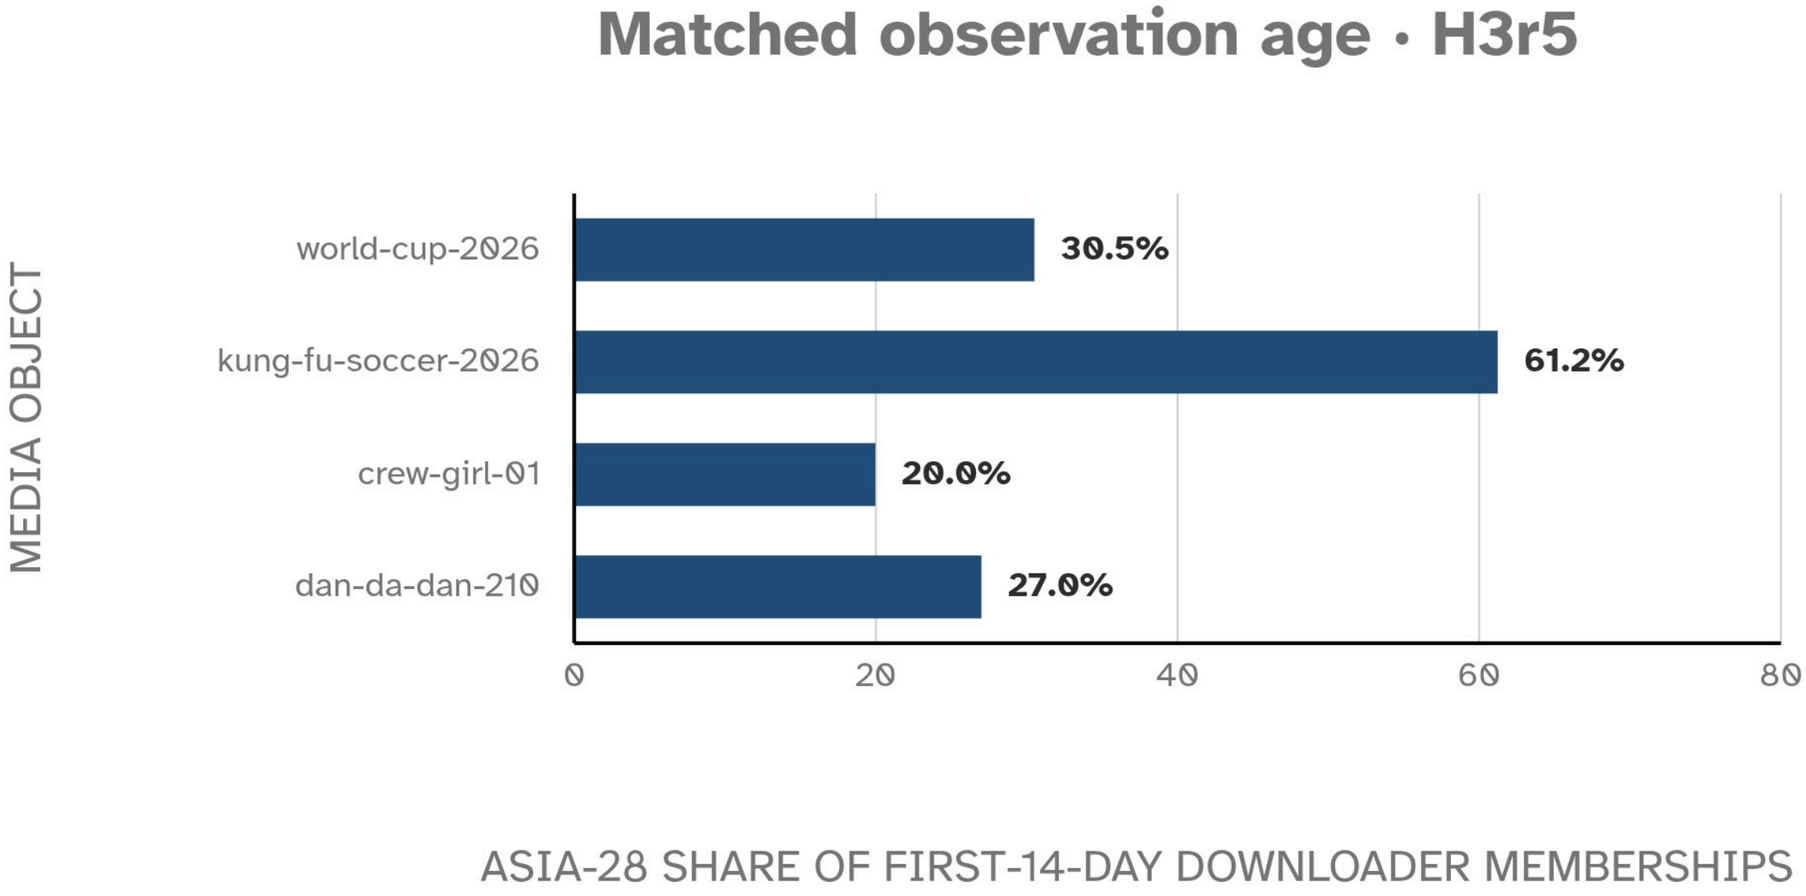

IPinfo often assigns many addresses to a city center. A fine H3 grid cannot turn those centroids into a defensible urban–rural split. No such population split is claimed here. The following is **concentration in labeled IPinfo locations**, which should be checked against hosting flags and geographic uncertainty before any urban interpretation.

Country	IPinfo city	D	Country share	Hosting flagged
South Korea	Seoul	2,318,205	36.4%	3.5%
South Korea	Incheon	565,614	8.9%	1.4%
South Korea	Busan	257,856	4.1%	0.1%
China	Nanjing	1,064,350	22.3%	0.1%
China	Shanghai	881,917	18.5%	19.9%
China	Hangzhou	790,537	16.6%	0.9%
Japan	Tokyo	205,902	26.4%	19.2%
Japan	Osaka	78,714	10.1%	17.5%
Japan	Yokohama	58,207	7.5%	0.8%

Compare the first 14 observed days

All four objects are compared at **H3r5**, with the same recorded IPinfo location database epoch and minimum of three downloaders. The primary measure sums each object's first 14 daily intervals: **IP–torrent–day memberships**, not 14-day unique people or unique peers. Full collection lengths differ, so their cumulative totals are not the primary comparison.

Object	Observation dates	Active torrents	World D-days	Asia-28 D-days	Asia-28 share
world-cup-2026	2026-06-29 to 2026-07-12	323	3,474,174	1,059,971	30.5%
kung-fu-soccer-2026	2026-10-03 to 2026-10-16	34	732,951	448,725	61.2%
crew-girl-01	2026-09-10 to 2026-09-23	195	1,454,905	290,505	20.0%
dan-da-dan-210	2025-09-04 to 2025-09-17	164	1,932,896	521,871	27.0%

The comparison controls observation age and grid resolution. Different release types, collection dates, discovery practices and active torrent supplies remain confounders. Open full-size izzi chart (SVG). Chart values and rendering specification (JSON).

Kung Fu Soccer has the largest Asia-28 share at 61.2%, compared with 30.5% for the World Cup. Its regional activity is heavily concentrated in China. The World Cup has a larger South Korean contribution. These are differences between the sampled media objects, not estimates of comparative fan populations.

The historical Dan Da Dan headers do not record a selection-policy label. An explicit check of its first 14 daily products found all 47,218 serialized cells at or above three downloaders, including 14,760 cells with zero uploaders, consistent with the downloader threshold used here. The underlying historical sample was not regenerated in this task.

Top ten World Cup torrents in China, South Korea, and Japan

Ranked by retained **downloader IP–canonical-torrent memberships**, June 29, 2026 — Round of 32 — through November 3. Uploader memberships are shown alongside, without changing the ranking. Ties use canonical BTIHA order. These are sampled file-distribution rankings, not match audiences or completed downloads.

The per-torrent H3r8 threshold requires three downloaders in a cell. Each percentage uses **all retained per-torrent downloader memberships in that country**, including files outside the top ten. That denominator differs from the collection-aggregate country totals elsewhere on this page. The filename is descriptive evidence; the full BTIHA is the identity. Synthetic duplicate-group prefixes are removed from display filenames only.

China

The full per-torrent denominator is **4,741,759 D** and **49,490 U**. The top ten account for **5.34%** of D.

China and South Korea share 8 top-ten hashes; China and Japan share 8; South Korea and Japan share 10. This compares file rankings, not whether the same people watched them.

Download every ranked torrent and exact counts (CSV) · Inspect reductions and source hashes

China: World Cup versus Kung Fu Soccer

Many of the same hubs, with markedly different concentration. In each collection's first 14 observed days, Nanjing accounts for **30.3% of World Cup downloader memberships and 59.9% of Kung Fu Soccer's**. Eight cities appear in both top-ten lists, but the normalized city distributions overlap by only **59.5%**. World Cup activity is more spread across Shanghai, Hangzhou and Shenzhen. This describes the geography of observed distribution; it does not estimate viewers or comparative national popularity.

The network profiles also differ. Hosting flags cover **5.05% versus 0.53%** of China downloader memberships; VPN flags cover **2.04% versus 1.09%**. Mobile-carrier shares are closer. Neither collection has a retained satellite-flagged China membership in any of the four windows. A zero flag count does not establish that a network type was absent.

Comparable windows and coverage

The main comparison uses **H3 resolution 8 for both objects**, freshly regenerated Kung Fu Soccer geography, the same frozen IPinfo databases and the same minimum of three downloaders per cell. World Cup sampling starts **June 29, 2026 — Round of 32**. Kung Fu Soccer starts October 3. Comparing the first 14 dates controls observation age; comparing the same October dates controls calendar time. Neither controls release type or discovery effort.

Primary comparison · collection aggregate threshold · H3r8

Collection	First 14 dates	Torrents with daily cache / full catalog	China D-days	China U-days	China share of world D-days
World Cup	2026-06-29 to 2026-07-12	323 of 493	359,440	8,191	10.4%
Kung Fu Soccer	2026-10-03 to 2026-10-16	34 of 35	399,602	80,717	55.2%

D-days and U-days are sums of daily IP–canonical-torrent memberships. The same address can count on several torrents and days, and in both roles. They are neither completed transfers nor bandwidth. “Torrents with cache” measures observation coverage, not how many have China activity.

Explore places and network types

The controls update both charts and the exact network table. The prose and tables below the explorer retain the first-14-day comparison unless explicitly labeled otherwise.

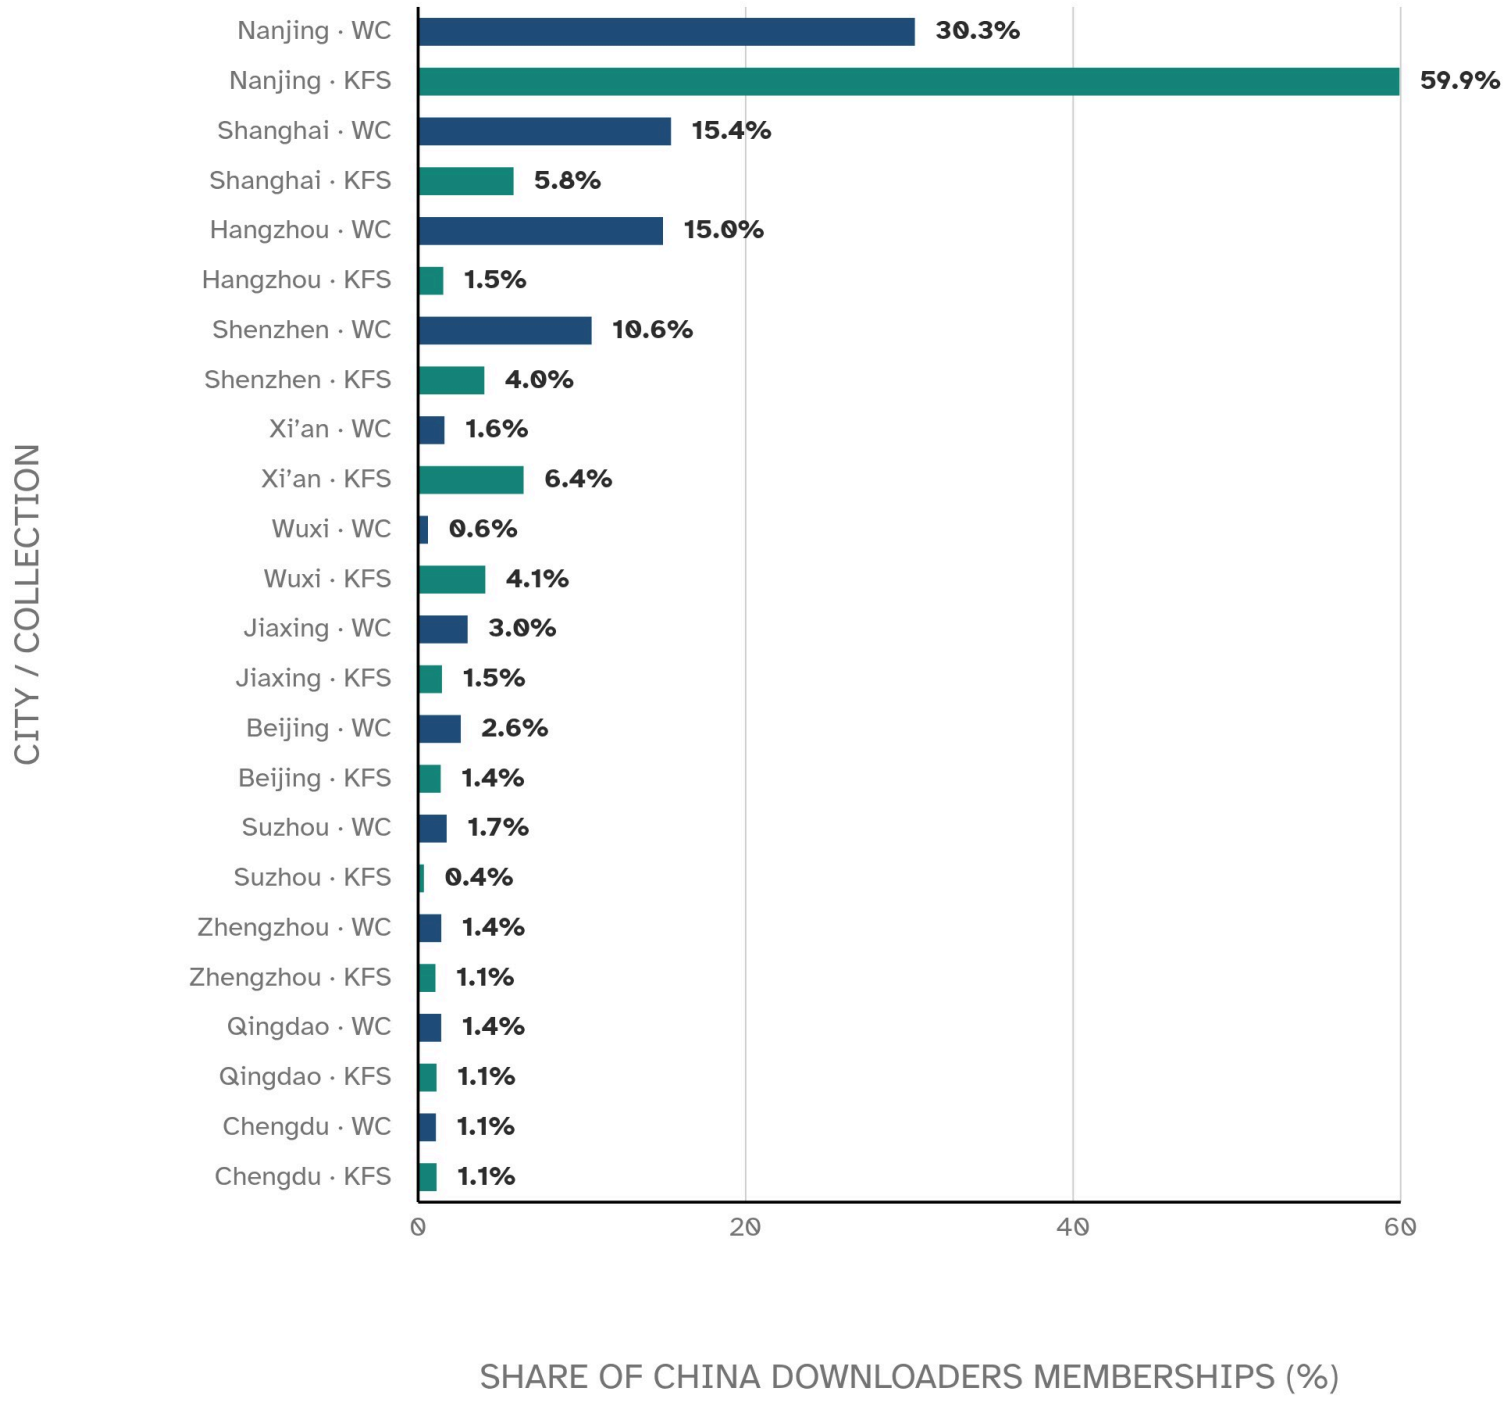

PDF edition: all eight published explorer views follow. The page narrative and preceding tables retain their original first-14-day scope.

Chengdu	Sichuan	3,902	1.1%	4,503	1.1%

Seven leading province-level labels · first 14 days

Province or municipality	World Cup D share	Kung Fu Soccer D share
Jiangsu	32.9%	64.5%
Zhejiang	20.1%	3.7%
Shanghai	15.4%	5.8%
Guangdong	12.7%	4.7%
Shaanxi	1.6%	6.4%
Beijing	2.6%	1.4%
Fujian	2.5%	0.5%

Jiangsu's larger Kung Fu Soccer share is chiefly Nanjing, with Wuxi also prominent. World Cup distribution has substantially larger Zhejiang, Shanghai and Guangdong shares. All retained China memberships in the compared windows join to a province-level label in the pinned IPinfo crosswalk; that is join completeness, not a measurement of geolocation accuracy.

For uploaders, Nanjing's shares are **54.7% and 80.4%**. The first-14-day city overlap is 70.7%, with seven common top-ten cities. This stronger pooled overlap is sensitive to the observation window and torrent weighting; it should not be read as evidence of a shared seeding organization.

The overlap statistic sums the smaller of the two normalized shares at every city. Identical city distributions score 100%; disjoint distributions score 0%. It never counts shared IPs or people. Spearman city-rank correlations are 0.706 for downloaders and 0.800 for uploaders, computed across the union of observed cities with absent memberships set to zero. These are descriptive, with no population significance test.

Network characteristics: retain role and denominator

All retained China memberships · first 14 days · overlapping flags

Positive flag	WC D count (share)	KFS D count (share)	WC U count (share)	KFS U count (share)

Tor (exit list)	0 (0.000%)	0 (0.000%)	0 (0.000%)	0 (0.000%)
Named privacy service	0 (0.000%)	25 (0.006%)	0 (0.000%)	0 (0.000%)

The largest first-window difference is hosting. World Cup uploader mobile and hosting shares are also higher, while uploader VPN shares are nearly equal. The 25 Kung Fu Soccer downloader relay flags and 25 named-service flags are separate marginal totals; matching counts do not establish that they refer to the same memberships.

IPinfo's hosting and VPN fields identify network characteristics; its mobile database maps IP ranges to carrier information. Mobile does not establish that a handset was used, and a VPN flag does not identify the person's location or motivation. "Named privacy service" means an identified privacy-service provider, not an OTT broadcaster. Carrier names, ASNs and service names are not retained in these aggregate products, so this analysis cannot establish that the two collections used the same operators. IPinfo privacy fields, mobile-carrier fields.

The native outputs do not report per-record classification completeness. Missing classifications can contribute zero flags; therefore unflagged activity cannot be labeled residential, direct, or known non-VPN. Tor uses both an IPinfo field and a separate exit-list field, shown separately.

How much of the network gap is the city mix?

Both collections are standardized to the same city weights: the mean of their two within-China city shares, restricted to cities observed in both. This is a descriptive adjustment, not a causal model. The common-city subset retains 99.9% of each downloader distribution and at least 99.7% of each uploader distribution.

Observed and standardized rates use the same common-city subset · first 14 days

Role / flag	Observed WC rate	Observed KFS rate	Same-city-weight WC rate	Same-city-weight KFS rate
Downloaders / Hosting	5.05%	0.51%	3.52%	1.06%
Downloaders / VPN	2.04%	1.09%	1.81%	1.24%
Downloaders / Mobile carrier	1.15%	1.32%	1.49%	1.61%
Uploaders / Hosting	2.73%	0.11%	1.76%	0.20%

Role / flag	Observed WC rate	Observed KFS rate	Same-city-weight WC rate	Same-city-weight KFS rate
Uploaders / VPN	1.15%	1.12%	1.08%	1.07%
Uploaders / Mobile carrier	2.98%	0.38%	1.86%	0.74%

For downloaders, the World Cup–Kung Fu Soccer hosting gap is 4.54 percentage points on the common-city subset. The symmetric decomposition assigns 2.07 points to the different city mix and 2.47 points to differences within cities. Higher World Cup hosting rates persist after matching the city weights.

Does the finding survive alternative comparisons?

Time-window sensitivity · all memberships · H3r8

Window	WC dates	KFS dates	D city overlap	U city overlap	WC Nanjing D share	KFS Nanjing D share
First 14 collection days	2026-06-29 to 2026-07-12	2026-10-03 to 2026-10-16	59.5%	70.7%	30.3%	59.9%
Collection days 15–28	2026-07-13 to 2026-07-26	2026-10-17 to 2026-10-30	48.0%	44.5%	28.6%	73.1%
Same dates: October 3–16	2026-10-03 to 2026-10-16	2026-10-03 to 2026-10-16	54.7%	21.1%	26.8%	59.9%
Same dates: October 17–30	2026-10-17 to 2026-10-30	2026-10-17 to 2026-10-30	46.2%	33.3%	27.6%	73.1%

Kung Fu Soccer is more concentrated in Nanjing in every window. Uploader geography is much less stable: World Cup's October 3–16 uploader distribution is led by Shanghai at 47.0%, while Kung Fu Soccer's is led by Nanjing at 80.4%. Matching dates therefore gives only 21.1% uploader city overlap. Calendar matching compares an older World Cup catalog with newly observed Kung Fu Soccer releases.

One flag removed at a time · first 14 days · no new cell threshold

Separate exclusion	D overlap	WC Nanjing D share	KFS Nanjing D share
None	59.5%	30.3%	59.9%
Hosting	61.1%	31.9%	60.2%
VPN	59.7%	30.6%	59.9%
Mobile carrier	59.1%	30.6%	60.7%
Proxy	59.5%	30.3%	59.9%

The location difference persists when each flag is removed separately. Nanjing itself has only 65 World Cup and nine Kung Fu Soccer hosting-flagged downloader memberships in this window. Removing the observed hosting flags does not explain away its concentration. It also does not establish residential demand, because unflagged infrastructure and geolocation centroids remain possible.

First two observed weeks · per-torrent threshold · IP–torrent–week memberships

Collection / role	China-positive torrents	Largest torrent share	Pooled Nanjing share	Equal-torrent Nanjing share	Nanjing share after dropping one torrent
World Cup / downloaders	276	1.6%	30.5%	27.5%	29.8% to 30.5%
World Cup / uploaders	256	12.4%	58.0%	13.4%	53.5% to 59.3%
Kung Fu Soccer / downloaders	34	5.2%	61.9%	58.9%	61.3% to 62.6%
Kung Fu Soccer / uploaders	34	7.2%	81.5%	72.0%	81.1% to 81.9%

This separate weighting check uses weekly products so each canonical torrent can receive equal weight. Its counts differ from the daily aggregate because both the interval and threshold placement differ. Downloader city overlap remains 59.3% with equal torrent weights, and no single omitted torrent removes the Nanjing gap. Equal weighting changes uploader overlap to 35.8%, versus 72.8% when weekly memberships are pooled. A "typical torrent" and the dominant uploader mass answer different questions; small torrents get much more influence under equal weighting.

Across all four windows and both roles, changing H3r8 to H3r5 changes city overlap by less than 0.2 percentage points. Resolution sensitivity is small here, but city centroids remain city centroids at either grid resolution. There is no defensible neighborhood-scale or urban–rural claim.

China study: sources, exports and reproducibility

China means the native `CHN` label; `HKG`, `MAC` and `TWN` remain separate geographic codes. A cell's country and city labels come from the first retained constituent location, not a dominant-location vote. Province labels join GeoNames IDs to the same IPinfo location snapshot, dated May 5, 2026. All five frozen database checksums are recorded. The shared snapshot makes backend versions comparable; it does not establish location or network accuracy on the collection dates.

Kung Fu Soccer has 36 original torrent files joined to 35 canonical identities using original metainfo hashes; World Cup has 493 canonical identities. No media-probe data were supplied for Kung Fu Soccer, and that missing coverage is explicit. Native daily aggregate products retain uploaders only in cells with at least three downloaders. The weekly weighting check thresholds each torrent separately. Combined flag exclusions cannot be reconstructed by summing overlapping marginal flags.

These are observational comparisons of sampled distribution. Shared city labels, geography adjusted network rates, and matching watermarks cannot identify shared viewers or operators. A subsequent provider-level study would need pinned ASN/carrier/service fields, lookup-success indicators and joint flag combinations, with aggregate publication and explicit coverage checks.

China, Haaland, and Japan-related matches

NBC's July 9 report describes Haaland's Chinese social-media following and the nickname "Ha Bao," translated as "Baby Ha." This provides context for a hypothesis about player-centered interest; it does not establish an effect on torrent distribution. NBC News reporting

Cohort	Torrents	China D	China share of world D	China U
All torrents	493	4,741,759	9.06%	49,490
Norway-tagged eligible match torrents	38	414,482	8.93%	3,549
Japan-tagged eligible match torrents	4	20,972	8.74%	324

China's downloader share is **8.93% for Norway-tagged matches**, versus **9.06% across all torrents** under the same per-torrent filtering. That does not show an elevated China share in this comparison, and it does not disprove Haaland fandom. Match timing, torrent supply and source differences remain uncontrolled.

The Japan-tagged cohort has four torrents, all for **Brazil–Japan in the Round of 32**. Its 20,972 China-located downloader memberships demonstrate circulation of that match's files. They do not reveal whether peers favored Japan, Brazil, a player, or neither. Four versions of one match are not four independent observations of fandom.

Supported findings and next tests

1. **Descriptive finding:** South Korea leads this Asia-28 distribution and China is second; the ordering survives each separate network exclusion examined.
2. **Descriptive finding:** the collection has a long post-final tail, accompanied by substantial catalog growth. Compare fixed torrent cohorts and equal post-discovery windows to separate those effects.
3. **Inference limit:** neither the Norway nor Japan comparison identifies a causal fandom or meme effect. A stronger test needs match-level cohorts, comparable opponents and stages, source/language controls, and uncertainty clustered by match rather than by millions of dependent peer observations. No population significance claim is made from these data.

Sources, downloads, and counting rules

Asia-28 and temporal CSV · Cohort comparisons · Daily catalog coverage · Region definition

All content joins use the shared inventory: **493 canonical BTIHA**, with verified hybrid-hash aliases. Alpha60 sampling began **June 29, 2026 — Round of 32**, and ends November 3 in this snapshot. Earlier-event media found later does not establish earlier sampling.

Geographic counts are **IP–torrent memberships**, with an IP counted once per canonical torrent and role within the stated interval. They are not unique people, viewing choices, completed downloads, transferred bytes, or ratings. An address can occur in both roles. Daily sums count the same membership again on another day.

Main geography uses **IPinfo and H3 resolution 8**, the highest resolution used here. The native minimum is **three downloaders per cell**; uploaders are retained only where that downloader threshold passes. Content comparisons filter each torrent separately. Overall country and city comparisons filter after aggregating torrents, so their totals differ. Country and city labels are representative locations within cells, and the finer grid does not improve IPinfo accuracy. Hosting, VPN, proxy and mobile flags overlap; each sensitivity exclusion is applied separately.

See the H3r8 manifest, generation and validation evidence, complete analytical reductions, and methods and coverage. Source hashes make the published snapshot inspectable.

Latin America and South America

Read the published page online

Brazil leads the observed regional distribution. Hosting shares are low; Spanish and Portuguese source coverage remains a priority.

Regional results and boundaries

Brazil leads both regional views. Across the full World Cup snapshot, Latin America and the Caribbean account for 5,184,562 downloader memberships; South America accounts for 3,559,156. Brazil contributes 2,509,871. Hosting flags cover only 1.4% and 1.6% of the two regional downloader totals, far below the US shares in the companion network study.

Sampling began **June 29, 2026 — Round of 32** and runs through November 3. These are observations of sampled peer-to-peer distribution, including later circulation of earlier matches. They do not measure the tournament's live audience, national fandom or completed viewing.

"Latin America" uses **UN M49 Latin America and the Caribbean (419)**: 52 countries or areas across Mexico, Central America, the Caribbean and South America. **South America (005)** is its 16-country-or-area subset. This geographic definition includes territories and places whose main languages are neither Spanish nor Portuguese. South America is already inside the first total; **do not add the two regions together**. The USA and Canada are outside both. Official UN M49 definition

Cumulative June 29–November 3 · H3r8 collection aggregate

Region	D	Share of world D	U	Share of world U	D hosting	U hosting

Mexico City and São Paulo lead the broader region's downloader location totals. In South America, São Paulo and Buenos Aires lead. City labels group representative IP geolocation points, not precise households. Low hosting shares do not establish residential access or local viewers.

Network characteristics

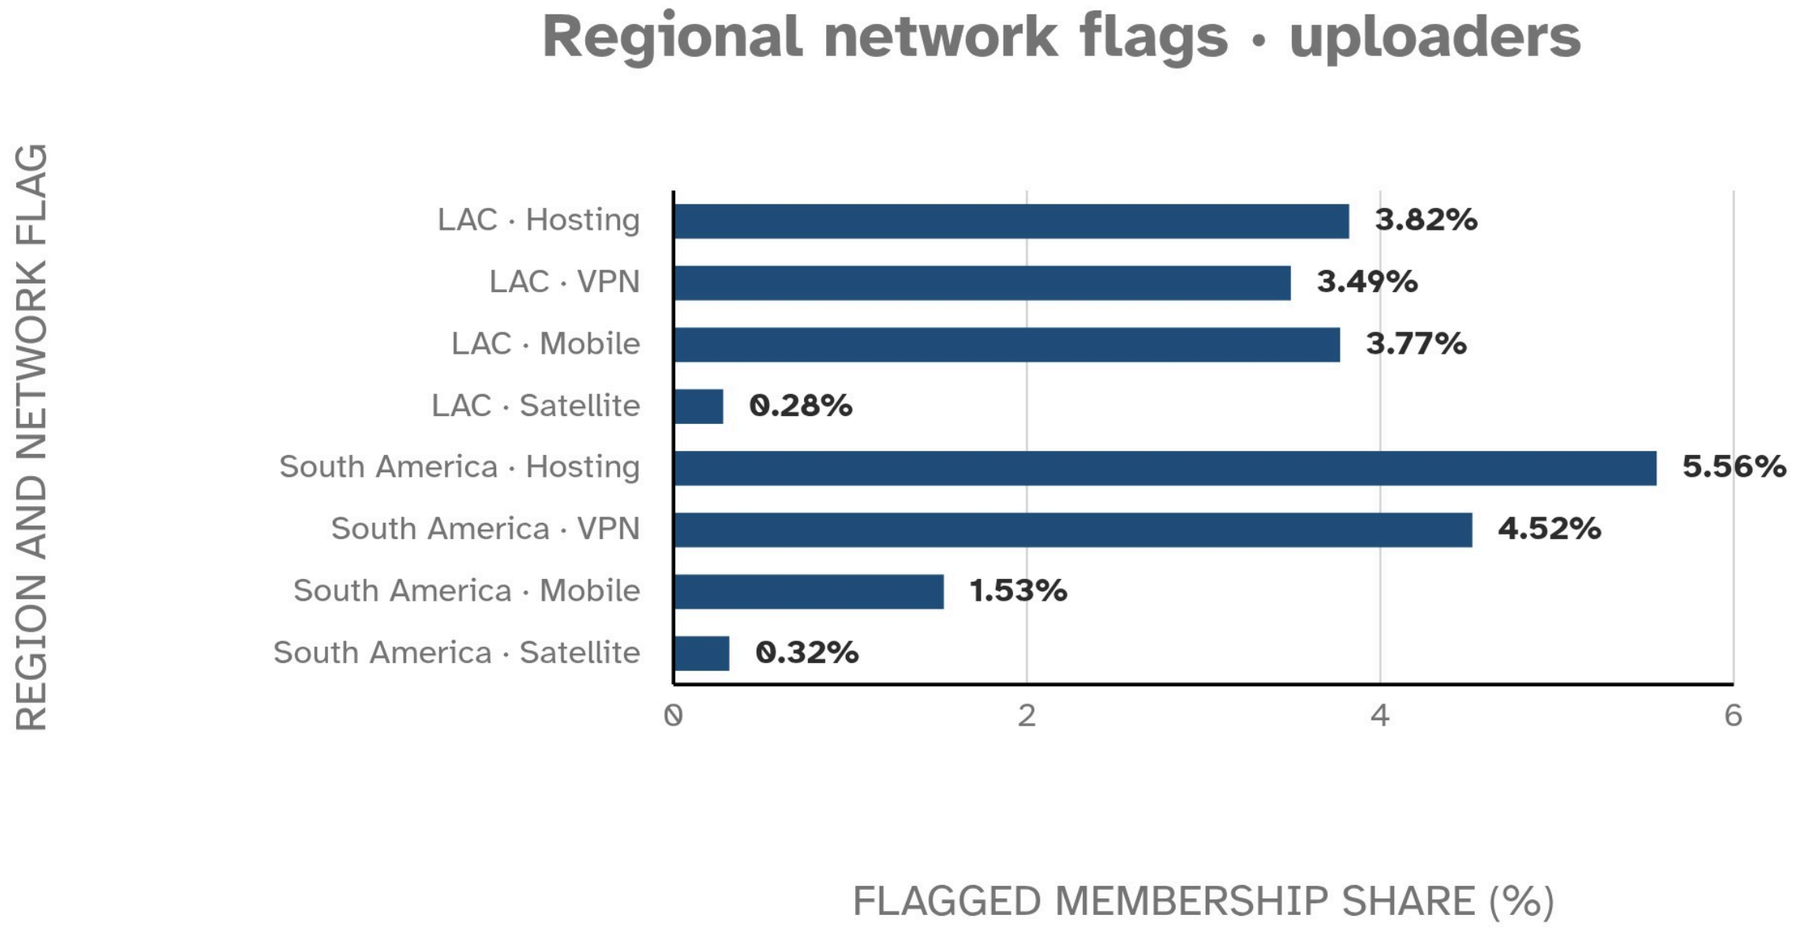

Hosting and VPN flags are much less prevalent here than in the USA. Mobile downloader shares are about 1.7% in both regional views; satellite downloader shares are about 0.2%. Uploader composition differs: South America's hosting share is 5.6%, compared with 3.8% in the broader region. Flags overlap and are not a partition of the population.

Daily activity and changing coverage

Both regions reach their largest observed daily downloader count on **October 14**, well after the July 19 final. About **92.5% of summed daily downloader memberships occur after the final** in each region. This is not a measure of delayed viewing: the later interval is longer, the catalog changes, and memberships repeat across dates. The lines show both absolute counts and world shares, with catalog coverage below.

Daily downloader memberships

June 29 — Round of 32 — through November 3, 2026 · H3r8

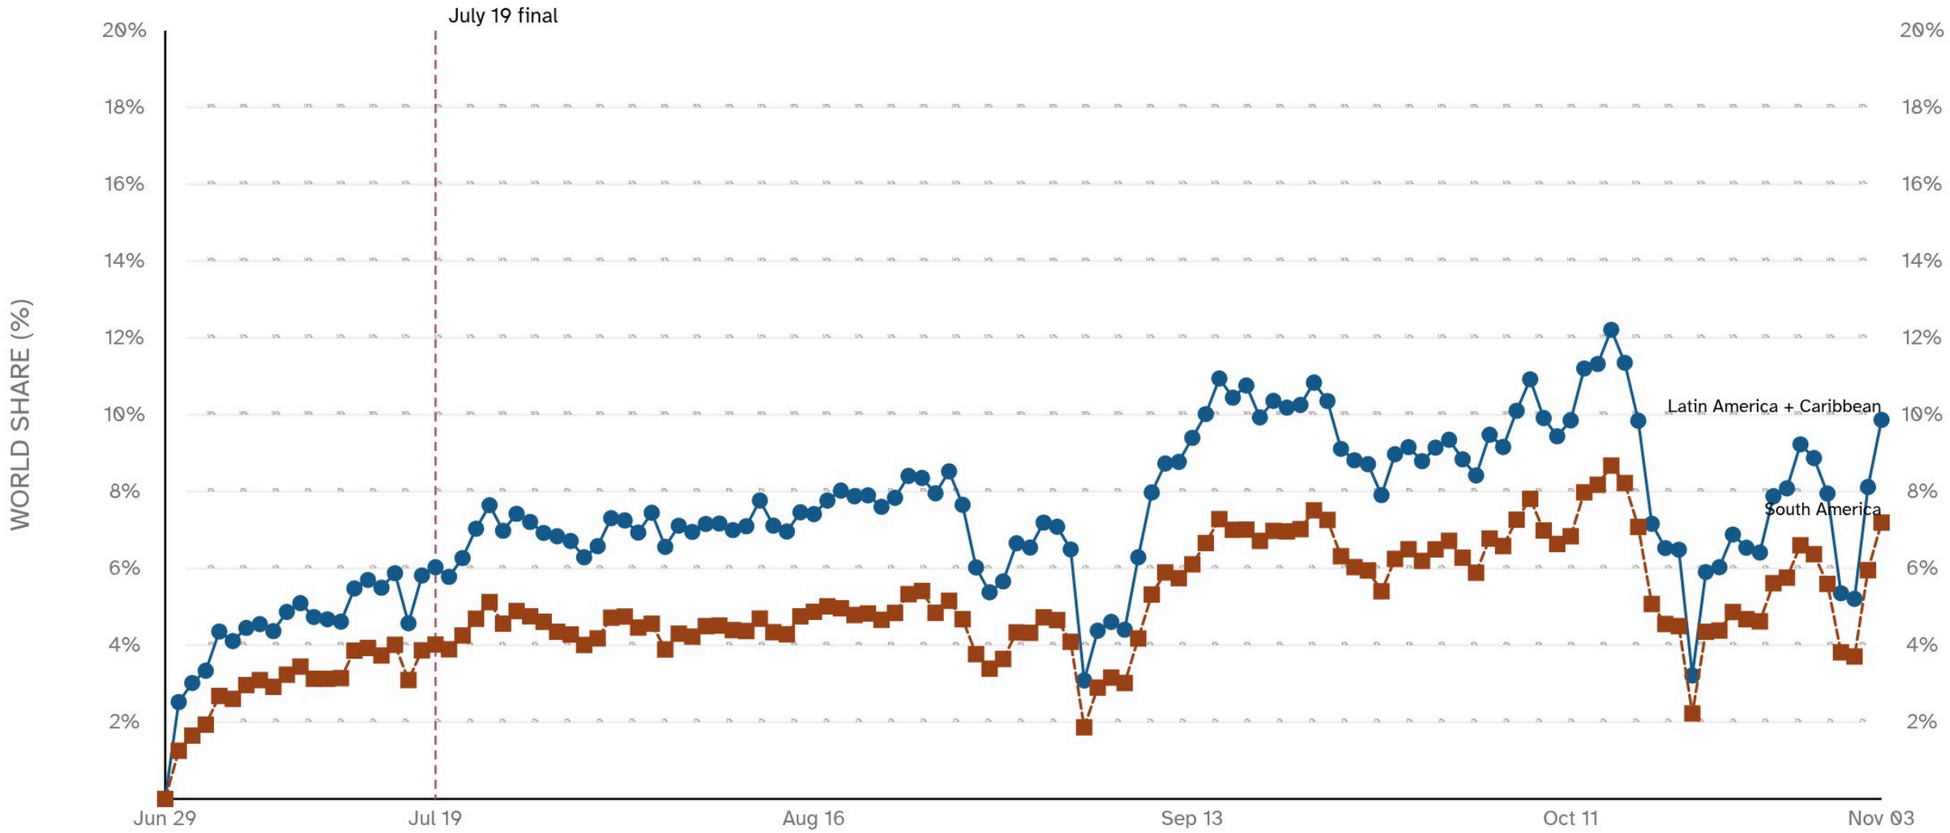

Daily aggregate memberships · changing catalog · nested regions

Counts, world shares and catalog coverage use aligned dates. South America is included in the broader region at every point. Open full-size izzi chart (SVG). Chart values and rendering specification (JSON).

Daily share of world downloader memberships

Counts, world shares and catalog coverage use aligned dates. South America is included in the broader region at every point. Open full-size izzi chart (SVG). Chart values and rendering specification (JSON).

Comparison with other media objects

Aligning the first 14 collection dates gives Latin America and the Caribbean 4.6% of World Cup downloader memberships, 8.4% of Crew Girl, 7.7% of Dan Da Dan and 5.2% of Kung Fu Soccer. South America's shares are 3.1%, 5.6%, 5.9% and 2.5%. These are within-collection geographic shares, not market penetration: release types, catalogs and calendar dates differ. The North America comparison gives the exact windows, network sensitivities and final-date Crew Girl identity policy.

First 14 collection dates · regional shares

H3r8 daily aggregates with a common IPinfo snapshot. LAC and South America overlap; they must not be summed. Open full-size izzi chart (SVG). Chart values and rendering specification (JSON).

Languages and leading torrents

The catalog contains **seven torrents with identified Spanish audio and none with identified Portuguese audio**. That is a sampling and metadata result, not evidence that Portuguese files do not circulate. Unknown audio remains substantial. Track presence does not establish which track was selected, spoken language, or location of the viewer. The 2027 preparation report describes ways to broaden Spanish and Portuguese discovery and incorporate non-torrent sources.

These language counts and torrent rankings use the **per-torrent** H3r8 threshold. Their denominators differ from the aggregate geography above. Language categories overlap where a file has several tracks.

Region	Audio evidence	Catalog torrents	D	Share of regional per-torrent D
Latin America and the Caribbean	English	188	1,748,367	37.8%
Latin America and the Caribbean	Spanish	7	99,948	2.2%
Latin America and the Caribbean	Portuguese	0	0	0.0%
Latin America and the Caribbean	No identified audio language	158	1,209,780	26.2%
South America	English	188	1,170,043	37.9%
South America	Spanish	7	67,073	2.2%
South America	Portuguese	0	0	0.0%
South America	No identified audio language	158	804,895	26.1%

Download every regional and Asian torrent ranking.

Implications for the next sample

Brazil's large observed distribution, combined with absent identified Portuguese audio, makes Portuguese discovery a clear coverage priority. Track the search source, language claim, discovery date, first observed cache and validated audio tracks for each new hash. Compare versions of the same match over the same availability window before interpreting a regional preference.

Preserve countries and territories with zero retained counts, and keep small uploader denominators visible. A zero after the H3r8 threshold does not prove no activity. Compare per-torrent and aggregate retention, and retain the H3r5 sensitivity when examining sparse locations. The same cells, addresses and media can contribute to overlapping regions and flags, so neither should be treated as independent populations.

Sources, exact values, and comparison rules

Complete reductions · All network counts and shares · Per-torrent weekly sensitivity counts · Native ID to canonical BTIHA crosswalk · New native products and validation manifest · Independent verification · Analysis implementation

The main comparisons use **IPinfo at H3 resolution 8**, with at least three downloaders per cell. Both roles are retained in passing cells. The common, frozen IPinfo databases are applied to every archive: these are snapshot classifications, not verified historical network labels for each observation date. The location database was built May 5, 2026. Dan Da Dan's observation window precedes that snapshot. Database provenance

Daily country comparisons filter the collection aggregate and sum 14 daily IP–canonical-torrent memberships. The same address can recur across torrents, days and roles. Weekly sensitivity results sum two independently deduplicated weekly per-torrent products with a per-torrent cell threshold. Cumulative torrent rankings use their own per-torrent denominator. These grains are not interchangeable.

Hosting, VPN, mobile, satellite, Tor, exit-list, proxy, relay and service are **overlapping flags**. They do not identify viewers, device types, actual traffic, VPN users' origin, or a particular hosting provider. No flag is not proof of a residential connection. The retained products do not expose joint flag intersections, ASN/provider names, or per-record lookup success, so those comparisons cannot be recovered from these marginals.

Crew Girl uses the torrent bytes in `alpha60-data` at the end of its September 23, 2026 sample: commit `6caf08e38f4fed66d76ab9fbc9e4d188a65945f0` (the last preceding commit, September 22). **196 original files resolve to 195 canonical BTIHA.** Every observed cache name joins that snapshot. Later catalog additions are excluded. Archive indices and regenerated native indices are joined through verified metainfo hashes. Frozen-catalog receipt · Crew Girl inventory · Dan Da Dan inventory

The source-file checksums, region definitions, catalog coverage, all nine flags and both H3 resolutions are retained in the downloads. No peer addresses are published by this follow-up.

Sources, downloads, and counting rules

Regional and network analysis · UN region definitions · Torrent rankings

All content joins use the shared inventory: **493 canonical BTIHA**, with verified hybrid-hash aliases. Alpha60 sampling began **June 29, 2026 — Round of 32**, and ends November 3 in this snapshot. Earlier-event media found later does not establish earlier sampling.

Geographic counts are **IP–torrent memberships**, with an IP counted once per canonical torrent and role within the stated interval. They are not unique people, viewing choices, completed downloads, transferred bytes, or ratings. An address can occur in both roles. Daily sums count the same membership again on another day.

Main geography uses **IPinfo and H3 resolution 8**, the highest resolution used here. The native minimum is **three downloaders per cell**; uploaders are retained only where that downloader threshold passes. Content comparisons filter each torrent separately. Overall country and city comparisons filter after aggregating torrents, so their totals differ. Country and city labels are representative locations within cells, and the finer grid does not improve IPinfo accuracy. Hosting, VPN, proxy and mobile flags overlap; each sensitivity exclusion is applied separately.

See the H3r8 manifest, generation and validation evidence, complete analytical reductions, and methods and coverage. Source hashes make the published snapshot inspectable.

WORLD CUP 2026 · STAGE ONE · NOVEMBER 6, 2026

Preparing for the 2027 World Cup

Read the published page online

Begin before the opening match, track discovery and sampling coverage, and probe languages per file and track. Treat the 2026 findings as design evidence rather than a forecast of 2027 viewers.

What changes in 2027

The FIFA Women's World Cup in Brazil runs **June 24–July 25, 2027**, with **32 teams and 64 matches**. The 2026 men's event involved 48 teams and 104 matches. A smaller fixture count does not imply a proportional reduction in torrent supply or observed membership. Team participation, language coverage, broadcast distribution and release practices will differ. FIFA 2027 information, FIFA 2026 format

As checked on November 6, Netflix identifies itself as the exclusive home of the 2027 tournament in **the United States and Canada**, with English and Spanish coverage in the USA and English and French coverage in Canada. This changes the source-branding and language hypotheses for North America. It does not establish what torrent releases will appear, or that a Netflix logo alone will prove a capture path. Netflix's 2027 viewing information

The present 2026 collection begins **June 29 — Round of 32**. A useful 2027 study should start before the opening match and preserve group-stage observations. The 32-team 2027 format should use its own stage registry; it should not inherit the men's 2026 Round of 32 labels.

Expectations to test, not audience forecasts

1. **Portuguese-language supply may be more visible with Brazil hosting.** Test this with deliberate Portuguese-source discovery and file-level track probes, rather than treating host-country language as a known property of every release.
2. **North American branding may become more concentrated while audio choices remain multilingual.** Record service, channel, commentary language and capture evidence separately. Multiple audio tracks may belong to one canonical torrent.
3. **Discovery and seeding may matter as much as match timing.** The 2026 collection's growing catalog and long post-final tail show why release age and match date need distinct clocks. No defensible numerical forecast of 2027 viewers follows from these memberships.

Finding more Spanish and Portuguese material

Expand the discovery frame before expanding the sampler. The 2026 inventory measures files Alpha60 found; a small Spanish or Portuguese cohort can reflect search coverage as well as supply. For 2027, maintain separate discovery lanes for Spanish, Brazilian Portuguese and European Portuguese, and measure their

coverage against the same fixture list. Keep multi-audio files eligible even when their titles advertise only English.

Start with the actual broadcast feeds

As checked on November 6, 2026, Netflix confirms Spanish-language coverage in the USA. Add `Netflix` and `NF` as source candidates for that territory, with the match, date and language terms. A broadcaster token is a search hint; the filename does not prove the audio language or capture source. Canada's announced Netflix languages are English and French. Netflix's 2027 coverage.

For Brazil, FIFA confirms Globo and CazéTV, including all 64 matches on SporTV and CazéTV. Add `Globo`, `SporTV`, `CazéTV` and `CazeTV` to the source registry. Free official digital coverage also supplies a useful reference feed for language and graphics checks; its availability does not predict how many torrent versions will appear. FIFA's Brazilian broadcaster announcement.

For Portugal, LiveMode's July 27 announcement identifies LiveModeTV and plans 25 matches, one per day. Treat this as a separate European Portuguese discovery lane, with its announced coverage recorded. Recheck all rights and schedules before collection; use verified territory-specific announcements for Spain and Latin America rather than carrying over the 2026 men's broadcasters. LiveMode's announcement.

A repeatable language search strategy

Lane	Search vocabulary and aliases	Verification
Spanish	`Copa Mundial Femenina`, `Mundial Femenino`, `fútbol`, `futbol`, `partido completo`, `español`, `espanol`, `castellano`, `latino`, `ESP`, `SPA`, `ES`	Probe every audio track; retain Spanish as the language and record regional commentary only when independently supported. `ESP` can also mean the Spain team.
Brazilian Portuguese	`Copa do Mundo Feminina`, `Copa Feminina`, `futebol`, `jogo completo`, `português`, `portugues`, `PT-BR`, `PTBR`, `POR`, `narração`	Confirm Portuguese audio and review any Brazil-specific claim; country of the peer or broadcaster branding alone does not establish the audio track.
European Portuguese	`Mundial Feminino`, `Campeonato do Mundo Feminino`, `futebol`, `PT-PT`, `PTPT`, `português`, `LiveModeTV`	Keep separate from Brazilian Portuguese at discovery time; retain generic Portuguese when the variety is unverified.
Multi-audio and weak labels	`dual audio`, `multi audio`, `MULTI`, language-neutral fixture/date searches, first-half and second-half variants	Inspect all files and tracks, not just the first video or default audio. Keep commentary, subtitles and ambient stadium audio distinct.

Generate queries from **fixture ID + local team aliases + date + language/source hints**. Search accented and unaccented spellings, `YYYY-MM-DD` and local date formats, both team orders, and UTC/local dates around midnight. A template such as `"Copa do Mundo Feminina" "{team A}" "{team B}" "2027"` is more selective than `POR` alone. Include `1T`, `2T`, `primeiro tempo`, `segundo tempo`, `primer tiempo`, `segundo tiempo`, extra time and penalties; classify highlights, full matches and studio programs separately. These are proposed search rules, not claims that matching releases exist.

Use a proposed polling schedule of 6.0, 24.0 and 72.0 hours and 7.0 days after each fixture for replay-file discovery, plus scheduled index-feed collection where available. Adjust to the source's documented request limits. Log the query, source, retrieval UTC, result ID, title, claimed languages, first-seen time and success/error

state. Preserve an actual zero-result response separately from a failed request.

Is there a specialized sports tracker?

Yes: SportsCult is a documented private sports-tracker candidate. Jackett's current adapter identifies it as private and exposes International Soccer, La Liga, Primeira Portugal and other sports categories. That establishes a sports-oriented index and adapter, not its current invitation availability, 2027 inventory, or Spanish/Portuguese coverage. The adapter's `en-US` value describes the index language, not all audio tracks. Jackett's SportsCult definition.

Include it in a coverage pilot if the project has normal account access and research collection is permitted there. Record its results as a distinct sampling stratum. Also pilot football replay indexes and regional language communities using their published search or RSS facilities; count verified new files each contributes before deciding where to invest collection effort. No additional named source is treated here as verified without checking its current catalog and access conditions.

A torrent **index** helps discover releases; a BitTorrent **tracker** helps locate peers for a known infohash. Adding more generic announce URLs does not create missing Spanish or Portuguese release metadata. Private torrents are also not a public-DHT substitute: the private-torrent specification restricts peer discovery. Consequently, public Alpha60 swarm observations cannot be assumed to represent private-tracker distribution. BitTorrent protocol, private torrents.

Verify supply and measure discovery coverage

Reuse the shared canonical BTIHA inventory for every discovered torrent, preserving source-specific listing IDs as aliases. Add a **media-asset layer** for identical files appearing under different torrents or on file hosts: whole-file SHA-256 proves byte identity, while audiovisual fingerprints can support a separately labeled relationship between remuxes or encodes. Similar names, sizes or watermarks are candidate matches, not identity proofs.

For material available to the study, run `ffprobe` on every relevant file and audio/subtitle track. Where tags are absent or conflicting, use speech-language detection on several commentary passages as a screening step, followed by bilingual review of a stratified sample and all conflicts. Crowd noise, music and brief announcer names are poor language evidence. Retain `unknown`, `claimed` and `verified` separately, with the method and confidence attached to each track.

Track **fixtures with at least one verified Spanish audio asset**, **fixtures with at least one verified Portuguese audio asset**, distinct assets per language, discovery delay, source overlap, unmatched identities, unknown-language share and successful query coverage. Use the same observed fixtures and follow-up period for language comparisons. Report each source's incremental canonical discoveries and verified-language yield, including its zero-result and inaccessible strata. A large number of versions of one match should not hide missing matches.

Streaming, IPTV, torrents and downloadable files

They are different distribution paths that can carry related recordings. IPTV describes delivery of television over IP; it includes licensed services as well as unauthorized redistribution. Web streaming may carry a live match or an on-demand replay. BitTorrent exchanges file pieces among peers, while a file host serves a

downloadable object. “Streaming” alone does not determine whether the delivery is licensed.

The technical boundary is also less sharp than “stream versus file” suggests. For example, HLS delivers playlists and media segments and can advertise alternative audio renditions. Record language metadata for each rendition where available, rather than assuming the video has only one commentary track. HTTP Live Streaming specification.

A plausible supply chain is: broadcast or OTT feed → live restream and/or recorded asset → remuxes and re-encodes → torrent releases, direct-download mirrors and on-demand streams. Some branches can start independently from the same broadcast, and a torrent file can later become a streaming replay. This is a hypothesis to test per asset, not an established lineage for the current World Cup collection. A logo can identify a feed family; it cannot prove which intermediary supplied a later copy. Use dated observations and content fingerprints, keeping first observed time distinct from true publication time.

Delivery path	Useful observable unit	What Alpha60 can infer
BitTorrent	Canonical torrent, observed peer membership and interval	Sampled file-distribution geography, with discovery, role, threshold and IPinfo limitations.
Live web/IPTV delivery	Channel or event listing, timestamped availability check, manifest or stream metadata when accessible to the study	Availability and infrastructure. A server IP locates infrastructure; it does not reveal the viewers.
File host / cloud download	Listing or object ID, observed file metadata, content hash when available	Persistence, mirrors and language supply. Published download counters require independent validation.
On-demand video platform	Video ID, upload time, duration, metadata and exposed counters	Platform-specific availability and reported engagement; these are not unique cross-platform viewers.

Do not add these measures into a single “piracy audience.” A torrent peer, a site visit, a file listing, a stream endpoint and a concurrent-viewer estimate have different denominators. The same recording or person may appear in several channels. Low torrent activity alongside widespread streaming listings is compatible with a channel shift, a discovery gap, or low demand; those data alone do not distinguish the explanations.

EUIPO’s cross-channel research explicitly treats visits to IPTV registration websites as a proxy for interest and models possible users separately. This is a useful methodological precedent: a registration-page visit is not an observed live match view. Its European aggregate results should not be transferred directly to Brazil, China, or a particular World Cup. EUIPO study and methodology.

Non-torrent sources for the 2027 study

Source	Access and useful fields	Main limitation
Official broadcaster schedules, EPGs and replay catalogs	Public pages or documented feeds; fixture, territory, commentary language, channel, live/replay times. Start with the verified broadcasters above.	A reference for supply and timing, not an unauthorized-distribution measure. Some feeds and archives require agreements.

Source	Access and useful fields	Main limitation
YouTube Data API and official channel catalogs	Documented API with quota/key requirements; video ID, title, duration, publish time, live status and available counters. Useful for CazéTV/LiveModeTV references and public replay discovery.	API availability and metadata vary; live concurrent-viewer fields stop being tracked after the event and may differ from processed analytics. Title language is not verified commentary. YouTube video fields.
Public replay forums, file-host listing pages and public event/stream indexes	Timestamped metadata observations through permitted public access, search/RSS or documented APIs; listing URL/ID, claimed language, event, host, first/last seen.	Uneven discovery, duplicates, rotating links and short lifetimes. Counts describe available listings or objects, not users. No current coverage estimate is claimed.
Google copyright Transparency Report and Lumen	Google supplies downloadable report data and links to participating takedown notices. Useful fields include reported URL/domain, reporting party and notice date; detailed Lumen access should be confirmed with the project.	Allegations and enforcement activity, not adjudicated infringement or demand. Reporting intensity and missing contributors bias the sample. Google report and Lumen description, download instructions.
Common Crawl	Public CDX/URL indexes and archived web content; domains, URLs, capture timestamps and replay-listing text.	Useful for retrospective discovery and link changes, but crawl gaps and delays make it unsuitable as a complete live-match monitor. Common Crawl URL index.
OONI measurements	Public existing website-connectivity measurements, with time, country, network and test results.	Access/blocking context only. An anomaly is not automatically confirmed blocking, and neither result counts viewers. Match coverage must be checked before using it. OONI interpretation guide.
Licensed commercial measurement, such as MUSO	Discuss event, territory, language, live-sports and delivery-channel coverage with the provider; request methodology and a sample before purchase.	Commercial access and modeled/platform-dependent measures. General industry coverage does not establish World Cup title-level or IPTV completeness. MUSO's published scope.

Public social posts and search results can supply additional discovery leads, but they need a documented sampling frame and duplicate handling. Private groups, subscription-platform analytics and server logs are not open research datasets. Broadcaster or platform partnerships could provide stronger aggregate audience measurements, if available; none are assumed in the present plan.

A concrete pilot before the tournament

Use a proposed **14.0-day pilot around at least four football fixtures** with confirmed Spanish and Portuguese feeds. Keep the same fixtures and observation schedule across sources. Run language-focused and language-neutral searches, one documented sports-index lane, public replay/file-host metadata collection, and official-feed controls. This tests discovery mechanics; it does not estimate the entire 2027 ecosystem.

Create one observation ledger keyed by source record and timestamp, linked to fixture ID and a separate media-asset ID. Attach BTIHA only when a torrent exists. Record delivery type, claimed/verified track languages, original source URL, accessible/error/removed status, source-code version and input checksum. Publish aggregate counts and coverage; strip access tokens and account-specific URLs from exports.

The pilot succeeds when every scheduled query has a success/error record, all candidate identities are either joined or explicitly unresolved, language decisions carry evidence, and the report exposes incremental discoveries by source and missing fixtures by language. If a source adds no verified assets, report that result rather than assuming its catalog is comprehensive. Add a separate event-time availability panel for streaming and a replay-distribution panel for files; join their content evidence without merging their audience denominators.

These are implementation recommendations and documented source candidates as of November 6, 2026. No new tracker account, paid dataset, private-group access or non-torrent collection has been acquired as part of this page update.

Source-check record and access limitations.

Start now: a prioritized implementation backlog

Priority	Work	Concrete acceptance check
1	Canonical identity and match registry	One BTIHA entry with original info-byte hashes, verified v1/v2 aliases, match ID, team IDs, stage, kickoff UTC and source provenance. No filename-only identity merges.
1	Observation and discovery ledger	Record discovery time, first successful poll, each attempt/error, tracker or DHT path, and active catalog membership. Distinguish an unobserved interval from a measured zero.
1	File- and track-level media inventory	Probe every relevant file in multi-file torrents. Preserve language, codec, channels, accessibility/disposition tags, duration and errors for each track. Report coverage per field.
2	Broadcaster evidence review	Retain filename claims, embedded metadata and several separated frames with hashes and timestamps. Require explicit conflict handling and an unknown category.
2	Matched comparison products	Produce fixed match cohorts plus 1-, 7- and 14-day windows after first observation. Publish active torrent counts and separate event-period and tail results.
2	Geographic accounting and uncertainty	Pin IPinfo snapshots, count missing coordinates, record H3r8 and H3r5 threshold losses, and retain independent country/region totals before H3 cell labels are assigned.
3	Network and sampling sensitivity	Store joint network-flag combinations so combined exclusions are unions, not sums. Stratify observation coverage and compare collector/trackers where available.
3	Reproducible publication	Version input manifests, identity joins, source evidence, transformations, chart data and validation receipts. Fail the build on unresolved joins or denominator drift.

The shared Python inventory, H3r8 wrapper support, threshold accounting and inspectable report exports built for this stage are reusable foundations. The remaining items above are a proposed 2027 backlog, not claims of completed infrastructure.

Proposed preparation schedule

When	Deliverable	Readiness check
November–December 2026	Freeze the schema and build the discovery ledger	Replay a 2026 sample and reproduce canonical counts and first-observed windows without manual joins.

When	Deliverable	Readiness check
January–February 2027	Add file-level language probes and source evidence workflow	A multilingual multi-file fixture retains every track and records undecodable files explicitly.
March–April 2027	Pilot on a comparable football collection	Sampling failures, missing source classes and duplicate hashes appear in an operational coverage report.
May 2027	Run an end-to-end rehearsal	Regenerate a bounded sample, compare H3 resolutions and network exclusions, and publish all charts with reconciled denominators.
Before June 24, 2027	Begin the event collection and freeze the initial cohort definitions	All planned collection paths have recent successful health checks; the match registry and language/source sampling targets are reviewed.
During and after the tournament	Maintain event-time and release-age reports	Keep daily collection coverage and fixed 7- and 14-day match views; continue a clearly labeled post-final tail.

Measurement rules worth preserving

- Report distinct torrents, IP–torrent memberships, and IP–torrent–day activity as different quantities. Never convert them into viewer counts without an independent validated measurement model.
- Keep a fixed cohort view alongside the expanding catalog. Normalize exposure only with a documented observation ledger.
- Analyze language availability separately from track selection, ethnicity, service branding and rights ownership.
- Cluster uncertainty by match or release family where those units are independent enough; a large count of repeated network observations does not provide millions of independent samples.
- Use H3r8 for geographic detail, H3r5 for sensitivity, and broader areas when geolocation uncertainty dominates. A defensible urban–rural study requires appropriate boundaries and location uncertainty, not city labels alone.

The highest-value next investment is **coverage instrumentation plus exhaustive file-level language metadata**. It directly addresses the largest limitations in this study: changing torrent supply, unknown tracks, and sparse Spanish/French source coverage.

Sources, downloads, and counting rules

2026 inventory and coverage · Daily catalog changes · Geographic loss accounting

All content joins use the shared inventory: **493 canonical BTIHA**, with verified hybrid-hash aliases. Alpha60 sampling began **June 29, 2026 — Round of 32**, and ends November 3 in this snapshot. Earlier-event media found later does not establish earlier sampling.

Geographic counts are **IP–torrent memberships**, with an IP counted once per canonical torrent and role within the stated interval. They are not unique people, viewing choices, completed downloads, transferred bytes, or ratings. An address can occur in both roles. Daily sums count the same membership again on another day.

Main geography uses **IPinfo and H3 resolution 8**, the highest resolution used here. The native minimum is **three downloaders per cell**; uploaders are retained only where that downloader threshold passes. Content comparisons filter each torrent separately. Overall country and city comparisons filter after aggregating torrents, so their totals differ. Country and city labels are representative locations within cells, and the finer grid does not improve IPinfo accuracy. Hosting, VPN, proxy and mobile flags overlap; each sensitivity exclusion is applied separately.

See the H3r8 manifest, generation and validation evidence, complete analytical reductions, and methods and coverage. Source hashes make the published snapshot inspectable.

Sources and PDF counting rules

The ten source pages are linked at the beginning of their chapters. Their original sources, downloads and counting rules remain in place. The export does not recalculate, update or reconcile the research findings.

All expandable report content is printed. China explorer choices are materialized as eight separately labeled views. Interactive hovering, filtering and pan/zoom remain available on the websites. The audit’s Swarm Detail link opens the underlying geography online.

This screen edition uses optimized raster charts and maps, with links to the original graphics. Stacked line-chart panels are separated without changing marks, labels, integer time axes or full torrent names. The separate high-resolution atlas is unchanged. The same data can appear in more than one chapter and must not be summed across repeated views.

Public-page text, aggregate tables, full torrent titles and identifiers, and public figure assets are in scope. Raw peer observations, unpublished IP addresses, credentials, private conversations and build logs are excluded. Paths already printed on a public source page remain source evidence.

Narrative and tables remain selectable; figure labels are part of the raster images. Descriptive links, bookmarks, embedded fonts and repeated table headers are provided. Complete independent PDF/UA and assistive-technology validation: UNAVAILABLE.

Share summary

OBSERVED: the main audit records 493 unique BTIHs across 128 sample days, June 29–November 3, 2026. These torrent and downloader records are not a count of viewers. INFERRED: the regional and broadcast comparisons preserve their distinct sampling windows, hosting-network effects and attribution limits. MODELED: the rights chapter's subjective 2027 US-and-Canada valuation is USD 200M, with a USD 150M–250M range; its commercial scenario is a separate calculation. UNAVAILABLE: a defensible Mexico rights valuation and a person-level overlap between the broadcast and torrent audiences. SUPERSEDED: the earlier North America USD 220M point estimate remains withdrawn in the published rights chapter.

Aggregated portable prompt

INFERRED / AGENT SYNTHESIS — not transcript

```
document_type: world-cup-results-compilation
style: house-style
document_type_modifiers:
  - coda-share
evidence_scope:
  - The ten published Alpha60 World Cup report pages listed in this PDF, frozen on November 11,
2026, with their figures, aggregate tables, source notes and authored explorer views.
output_format: pdf

Create one searchable PDF of the nine World Cup sports reports and the main 2026 sample/cache
audit. Preserve their published findings, caveats, sources, downloads and counting rules. Expand
all disclosures and include all eight China explorer views with exact labels and values.
Rasterize charts and maps into optimized images only for this screen report PDF; leave the
separate high-resolution print atlas unchanged. Preserve chart data and labels, integer time
ticks, full torrent names and Spanish/French audio maps excluding Alaska, Hawaii and the Western
Aleutians. Separate stacked chart panels without changing their data. Keep broadcast audiences
distinct from IP-torrent memberships, and preserve observed, inferred, modeled, unavailable and
superseded evidence states. Do not recalculate the rights valuation or add unsupported
conclusions.

Use readable text and table layouts, large plates, linked contents, bookmarks and page numbers.
Keep raw observations, private IP addresses, credentials and conversations outside the export.
Append one terminal Coda / Share with this bounded synthesis, a labeled agent-synthesis prompt
and the sharing boundary. Validate the coda-share contract using its explicit project-local-
extension option; full canonical Devastation Pacific document-type validation is UNAVAILABLE
because the body preserves the existing website. Render every page and inspect for clipping,
overlap, missing figures and broken tables before delivery.
```
